Any and all priority claims identified in the Application Data Sheet, or any correction thereto, are hereby incorporated by reference under 37 CFR 1.57. FIELD OF THE INVENTION

The present invention relates to certain substituted pyridine and pyrazine compounds as inhibitors of PDE4 enzymes; derivatives of such compounds; compositions of such compounds; methods of making them; and their use in various methods, including detection and imaging techniques; enhancing neuronal plasticity; treating neurological disorders, including psychiatric, neurodegenerative, cerebrovascular, cognitive and motor disorders; providing neuroprotection; enhancing the efficiency of cognitive and motor training; facilitating neurorecovery and neurorehabilitation; and treating peripheral disorders, including inflammatory and renal disorders.

BACKGROUND OF THE INVENTION

The mammalian phosphodiesterases (PDEs) are a group of closely related enzymes divided into 11 families (PDE1-11) based on substrate specificity, inhibitor sensitivity and more recently, on sequence homology. The 11 families are coded by 21 genes, providing several of the families with multiple members. All mammalian PDEs share a conserved catalytic domain located in the COOH-terminal portion of the protein. In GAF-containing PDEs, one or both GAFs can provide dimerization contacts. In addition, one of the GAFs in each of these proteins provides for allosteric cGMP binding (PDE2, PDE5, PDE6, PDE11), allosteric cAMP binding (PDE10), and regulation of catalytic site functions (PDE2, PDE5, PDE6). The other families of PDEs have unique complements of various subdomains (UCR, NHR, PAS, membrane association) that contribute to regulation of activity. PDEs 1, 2, 3, and 4 are expressed in many tissues, whereas others are more restricted. In most cells, PDE3 and PDE4 provide the major portion of cAMP-hydrolyzing activity (Francis, *Physiological Reviews*, 2011, 91, 651-690).

The PDE4 family includes four isoforms (PDE4A, B, C and D) with more than 20 splice variants, making it one of the largest PDE subfamilies (Bender and Beavo, 2006). PDE4 enzymes hydrolyze cAMP with a substrate apparent Km of 1-5 uM for cAMP. The PDE4 enzyme is reported to be regulated by two upper control region (UCR) domains. Depending on

differential RNA splicing, PDE4 variants can be distinguished into two major subgroups: long and short forms (Conti et al., *J Biol Chem*., 2003, 278, 5493-5496). Nine splice variants have been reported. PDE4D1, 4D2 and 4D6 all are shorter forms lacking UCRs. PDE4D3, 4D4, 4D5, 4D7, 4D8 and 4D9 are longer forms that contain both UCRs and N-terminal domains important for their subcellular localization (Bender and Beavo, 2006). Long form PDE4D3 activity is increased by PKA phosphorylation via Ser54 in the N-terminal UCR1 (Alvarez et al., *Mol Pharmacol.,* 1995, 48, 616-622; Sette et al., *J Biol Chem.,* 1996, 271, 16526-16534). Conversely, Erk2 phosphorylation of Ser597 in the C-terminus of PDE4D3 causes a reduction in catalytic activity. One or several PDE4D isoforms are expressed throughout most tissues tested, including cortex, hippocampus, cerebellum, heart, liver, kidney, lung and testis (Richter et al., *Biochem. J.,* 2005, 388, 803-811). The localization and regulation of PDE4D isoforms is thought to allow for tight and local regulation of cAMP levels, possibly limiting signal propagation in specific subcellular compartments.

Numerous studies have highlighted a role for PDEs generally, and PDE4 in particular, in modulating intracellular signaling pathways that regulate many physiological processes, including those underling neural plasticity, cognition, and memory. In particular, PDEs play an important role in intracellular signal transduction pathways involving the second messengers. cAMP and cGMP. These cyclic nucleotides function as ubiquitous intracellular signaling molecules in all mammalian cells. PDE enzymes hydrolyze cAMP and cGMP by breaking phosphodiester bonds to form the corresponding monophosphates (Bender and Beavo, *Pharmacol. Rev.,* 2006, 58 (3), 488–520). PDE activities are modulated in coordination with adenylyl cyclase (AC) and guanylyl cyclase (GC) activities through direct effectors and feedback pathways, thereby maintaining cAMP and cGMP levels within optimum ranges for responsiveness to signals. The ability of extracellular signals to modulate the intracellular concentration of cyclic nucleotides allows cells to respond to external stimuli across the boundary of the cell membrane.

The cyclic nucleotide signaling cascades have been adapted to respond to a host of transduction systems including G-protein coupled receptors (GPCRs) and voltage and ligand gated ion channels. Cyclic nucleotides transmit their signal in the cell through a variety of tertiary elements. The best described of these are cAMP dependent protein kinase (PKA) and cGMP dependent protein kinase (PKG). The binding of the cyclic nucleotide to each enzyme enables the phosphorylation of downstream enzymes and proteins functioning as effectors or additional elements in the signaling cascade. Of particular importance to memory formation is cAMP activation of PKA, which phosphorylates cAMP response element-binding protein (CREB). pCREB is an activated transcription factor, which binds to specific DNA loci and

initiates transcription of multiple genes involved in neuronal plasticity. Both *in vitro* and *in vivo* studies have associated alterations in cyclic nucleotide concentrations with biochemical and physiological process linked to cognitive function (Kelly and Brandon, *Progress in Brain Research*, 2009, 179, 67-73; Schmidt, *Current Topics in Medicinal Chemistry,* 2010, 10, 222-230). Signal intensity and the levels of coincident activity at a synapse are established variables that can result in potentiation of transmission at a particular synapse. Long term potentiation (LTP) is the best described of these processes and is known to be modulated by both the cAMP and cGMP signaling cascades.

Focus on the role of PDE4 in memory stems from the discovery of the PDE4-like *Drosophila* learning mutant *dunce (*dnc gene*),* a cyclic nucleotide phosphodiesterase of the PDE4 subtype (Yun and Davis, *Nucleic Acids Research*, 1989, 17(20), 8313-8326). The dnc mutant flies are defective in acquisition and/or short-term memory when tested in several different olfactory associative learning situations, with negative (Dudai et al., *Proc Natl Acad Sci.,* 1976, 73(5), 1684-1688*;* Dudai Y., *Proc Natl Acad Sci.,* 1983, 80(17), 5445-5448; Tully and Quinn, *Journal of Comparative Physiology*, 1985, 157(2), 263-77) or positive reinforcement (Tempel et al., *Proc Natl Acad Sci.,* 1983, 80(5), 1482-1486). In mammals, PDE4D knockout animals display decreased immobility in the antidepressant tail-suspension and forced swim test models (Zhang et al., *Neuropsychopharmacology*, 2002, 27(4), 587-595), enhanced in vitro LTP in hippocampal CA1 slices (Rutten et al., *Eur. J. Neurosci.,* 2008, 28(3), 625-632), and enhanced memory in radial maze, object recognition, and Morris water maze tasks (Li et al., *J. Neurosci.*, 2011, 31, 172-183).

Such observations highlight the interest in PDE-inhibition, including PDE4-inhibition, as a therapeutic target for numerous disorders and in cognitive enhancement. For example, by increasing cAMP levels, such inhibitors may be useful in treating cognitive deterioration in neurodegenerative disorders such Parkinson's Disease and Alzheimer's Disease, as well as generally improving cognition in normal, diseased, and aging subjects. Various small-molecule PDE4 enzyme inhibitors have been reported *e.g.*, Aza-bridged bicycles (DeCODE Genetics; Intl. Pat. Appl. Publ. WO 2010/059836, May 27, 2010); *N*-substituted anilines (Memory Pharmaceuticals Corporation; Intl. Pat. Appl. Publ. WO 2010/003084, January 7, 2010); Biaryls (DeCODE Genetics; Intl. Pat. Appl. Publ. WO 2009/067600, May 28, 2009, WO 2009/067621, May 28, 2009); Benzothiazoles and benzoxazoles (DeCODE Genetics; U.S. Pat. Appl. Publ. US 2009/0130076, May 21, 2009); Catechols (DeCODE Genetics; U.S. Pat. Appl. Publ. US 2009/0131530, May 21, 2009), Pteridines (Boehringer Ingelheim International G.m.b.H.; U.S. Pat. 7,674,788, Nov 29, 2007); Heteroaryl pyrazoles (Memory Pharmaceuticals Corporation; Intl. Pat. Appl. Publ. WO 2007/123953, November 1, 2007); Naphthyridines (Glaxo Group

Limited; Intl. Pat. Appl. Publ. WO 2006/053784, May 26, 2006); Piperazinyldihydrothienopyrimidines (Boehringer Ingelheim International G.m.b.H.; EP Pat. 1,874,781, Jun 24, 2009); Nicotinamide derivatives (Pfizer; U.S. Pat. Appl. Publ. US 2005/0020587, January 27, 2005); Heteroarylmethyl phenyl amines (Memory Pharmaceuticals Corporation; U.S. Pat. 7,087,625, August 8, 2006); Naphthyridines (Novartis AG; EP Pat. 1,443,925, December 26, 2007; U.S. Pat. 7,468,370, Dec 23, 2008).

However, PDE4 inhibitors have generally been associated with numerous side effects – most notably emesis – that have typically limited their usefulness and tolerability (*e.g.*, Giembycz, *Curr. Opin. Pharm.* 2005, 5, 238-244). It is therefore desirable to develop improved PDE4 inhibitors such as those showing higher potency, greater specificity, and better side effect profiles. The present invention meets these and other needs in the art by disclosing substituted pyridine and pyrazine compounds as potent and well-tolerated PDE4 inhibitors.

TERMS AND DEFINITIONS

The use of subheadings such as "General," "Chemistry," "Compositions," "Formulations," *etc.*, in this section, as well as in other sections of this application, are solely for convenience of reference and not intended to be limiting.

General

As used herein, the term "about" or "approximately" means within an acceptable range for a particular value as determined by one skilled in the art, and may depend in part on how the value is measured or determined, *e.g.*, the limitations of the measurement system or technique. For example, "about" can mean a range of up to 20%, up to 10%, up to 5%, or up to 1% or less on either side of a given value. Alternatively, with respect to biological systems or processes, the term "about" can mean within an order of magnitude, within 5 fold, or within 2 fold on either side of a value. Numerical quantities given herein are approximate unless stated otherwise, meaning that the term "about" or "approximately" can be inferred when not expressly stated

To provide a more concise description, some of the quantitative expressions given herein are ***not*** qualified with the term "about". It is understood that, whether the term "about" is used

explicitly or not, every quantity given herein is meant to refer to the actual given value, and it is also meant to refer to the approximation of such given value that would reasonably be inferred based on the ordinary skill in the art, including equivalents and approximations due to the experimental and/or measurement conditions for such given value. Whenever a yield is given as a percentage, such yield refers to a mass of the entity for which the yield is given with respect to the maximum amount of the same entity for which that could be obtained under the particular stoichiometric conditions. Concentrations that are given as percentages refer to mass ratios, unless indicated differently.

As used herein, the terms "a," "an," and "the" are to be understood as meaning both singular and plural, unless explicitly stated otherwise. Thus, "a," "an," and "the" (and grammatical variations thereof where appropriate) refer to one or more.

A group of items linked with the conjunction "and" should not be read as requiring that each and every one of those items be present in the grouping, but rather should be read as "and/or" unless expressly stated otherwise. Similarly, a group of items linked with the conjunction "or" should not be read as requiring mutual exclusivity among that group, but rather should also be read as "and/or" unless expressly stated otherwise. Furthermore, although items, elements or components of the invention may be described or claimed in the singular, the plural is contemplated to be within the scope thereof unless limitation to the singular is explicitly stated.

The terms "comprising" and "including" are used herein in their open, non-limiting sense. Other terms and phrases used in this document, and variations thereof, unless otherwise expressly stated, should be construed as open ended as opposed to limiting. As examples of the foregoing: the term "example" is used to provide exemplary instances of the item in discussion, not an exhaustive or limiting list thereof; adjectives such as "conventional," "traditional," "normal," "criterion," "known," and terms of similar meaning should not be construed as limiting the item described to a given time period or to an item available as of a given time, but instead should be read to encompass conventional, traditional, normal, or criterion technologies that may be available or known now or at any time in the future. Likewise, where this document refers to technologies that would be apparent or known to one of ordinary skill in the art, such technologies encompass those apparent or known to the skilled artisan now or at any time in the future.

The presence of broadening words and phrases such as "one or more," "at least," "but not limited to," or other like phrases in some instances shall not be read to mean that the narrower case is intended or required in instances where such broadening phrases may be absent. As will become apparent to one of ordinary skill in the art after reading this document, the

illustrated embodiments and their various alternatives may be implemented without confinement to the illustrated examples.

Chemistry

The term "alkyl" refers to a fully saturated aliphatic hydrocarbon group. The alkyl moiety may be a straight- or branched-chain alkyl group having from 1 to 12 carbon atoms in the chain. Alkyl groups may be optionally substituted with one or more substituents including, but not limited to, hydroxyl, alkoxy, cyano, thioalkoxy, amino, and aminoalkyl.

The term "haloalkyl" refers to the alkyl moiety, which may be a straight- or branched-chain alkyl group having from 1 to 12 carbon atoms in the chain substituted with a halo group. The term "cyano" refers to the group -CN.

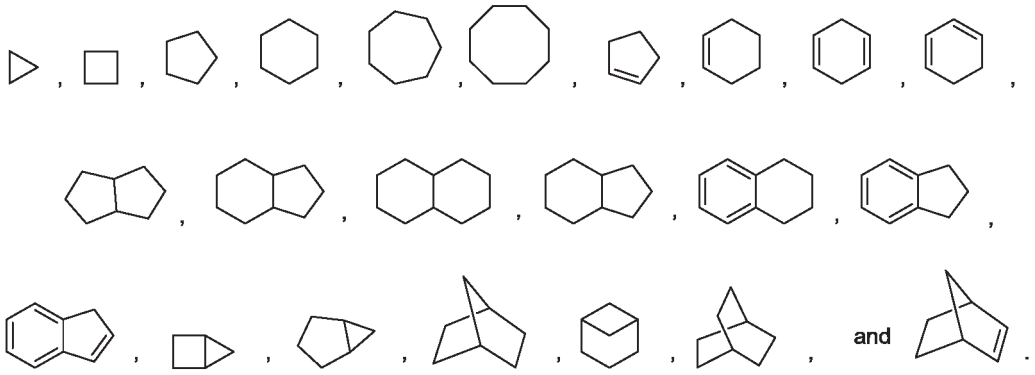
The term "cycloalkyl" refers to a saturated or partially saturated carbocycle, such as monocyclic, fused polycyclic, bridged monocyclic, bridged polycyclic, spirocyclic, or spiro polycyclic carbocycle having from 3 to 12 ring atoms per carbocycle. Where the term cycloalkyl is qualified by a specific characterization, such as monocyclic, fused polycyclic, bridged polycyclic, spirocyclic, and spiro polycyclic, then such term cycloalkyl refers only to the carbocycle so characterized. Illustrative examples of cycloalkyl groups include the following entities, in the form of properly bonded moieties:

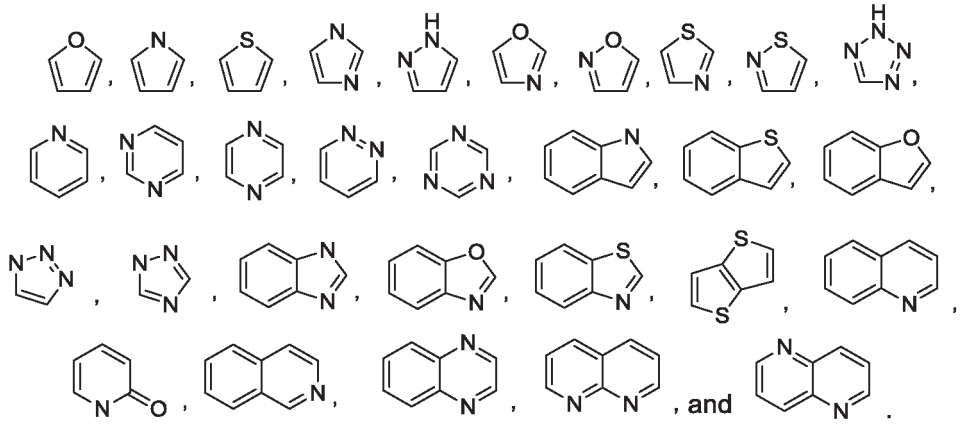


Those skilled in the art will recognize that the species of cycloalkyl groups listed or illustrated above are not exhaustive, and that additional species within the scope of these defined terms may also be selected.

The term "halogen" represents chlorine, fluorine, bromine or iodine. The term "halo" represents chloro, fluoro, bromo or iodo.

The term "heteroatom" used herein refers to, for example, O (oxygen), S (sulfur) and N (nitrogen).

The term "heteroaryl" refers to a monocyclic, fused bicyclic, or fused polycyclic aromatic heterocycle (ring structure having ring atoms selected from carbon atoms and up to four heteroatoms selected from nitrogen, oxygen, and sulfur) having from 3 to 12 ring atoms per heterocycle. Illustrative examples of heteroaryl groups include the following entities, in the form of properly bonded moieties:



The term "substituted" means that the specified group or moiety bears one or more substituents. The term "unsubstituted" means that the specified group bears no substituents. The term "optionally substituted" means that the specified group is unsubstituted or substituted by one or more substituents. Where the term "substituted" is used to describe a structural system, the substitution is meant to occur at any valency-allowed position on the system. In cases where a specified moiety or group is not expressly noted as being optionally substituted or substituted with any specified substituent, it is understood that such a moiety or group is intended to be unsubstituted.

Formulas

Any formula given herein is intended to represent compounds having structures depicted by the structural formula as well as certain variations or forms. In particular, compounds of any formula given herein may have asymmetric centers and therefore exist in different enantiomeric forms. All optical isomers and stereoisomers of the compounds of the general formula, and mixtures thereof, are considered within the scope of the formula. Thus, any formula given herein is intended to represent a racemate, one or more enantiomeric forms, one or more diastereomeric forms, one or more atropisomeric forms, and mixtures thereof. Furthermore, certain structures may exist as geometric isomers (i.e., *cis* and *trans* isomers), as tautomers, or as atropisomers.

The symbols and are used as meaning the same spacial arrangement in chemical structures shown herein. Analogously, the symbols and are used as meaning the same spacial arrangement in chemical structures shown herein.

Compounds

As used herein, a "compound" refers to any one of: (a) the actually recited form of such compound; and (b) any of the forms of such compound in the medium in which the compound is being considered when named. For example, reference herein to a compound such as R-COOH, encompasses reference to any one of, for example, R-COOH(s), R-COOH(sol), and R-COO-(sol). In this example, R-COOH(s) refers to the solid compound, as it could be for example in a tablet or some other solid pharmaceutical composition or preparation; R-COOH(sol) refers to the undissociated form of the compound in a solvent; and R-COO-(sol) refers to the dissociated form of the compound in a solvent, such as the dissociated form of the compound in an aqueous environment, whether such dissociated form derives from R-COOH, from a salt thereof, or from any other entity that yields R-COO- upon dissociation in the medium being considered.

As used herein, the term "chemical entity" collectively refers to a compound, along with the derivatives of the compound, including salts, chelates, solvates, conformers, non-covalent complexes, metabolites, and prodrugs.

In one aspect the chemical entity is selected from the group consisting of compounds of Formula (I), pharmaceutically acceptable salts of compounds of Formula (I), pharmaceutically acceptable prodrugs of compounds of Formula (I), and pharmaceutically acceptable metabolites of compounds of Formula (I).

In another example, an expression such as "exposing an entity to a compound of formula R-COOH" refers to the exposure of such entity to the form, or forms, of the compound R-COOH that exists, or exist, in the medium in which such exposure takes place. In still another example, an expression such as "reacting an entity with a compound of formula R-COOH" refers to the reacting of (a) such entity in the chemically relevant form, or forms, of such entity that exists, or exist, in the medium in which such reacting takes place, with (b) the chemically relevant form, or forms, of the compound R-COOH that exists, or exist, in the medium in which such reacting takes place. In this regard, if such entity is for example in an aqueous environment, it is understood that the compound R-COOH is in such same medium, and therefore the entity is being exposed to species such as R-COOH(aq) and/or R-COO-(aq), where the subscript "(aq)" stands for "aqueous" according to its conventional meaning in chemistry and biochemistry. A carboxylic acid functional group has been chosen in these nomenclature examples; this choice is not intended, however, as a limitation but it is merely an illustration. It is understood that analogous examples can be provided in terms of other functional groups,

including but not limited to hydroxyl, basic nitrogen members, such as those in amines, and any other group that interacts or transforms according to known manners in the medium that contains the compound. Such interactions and transformations include, but are not limited to, dissociation, association, tautomerism, solvolysis, including hydrolysis, solvation, including hydration, protonation and deprotonation. No further examples in this regard are provided herein because these interactions and transformations in a given medium are known by any one of ordinary skill in the art.

In another example, a "zwitterionic" compound is encompassed herein by referring to a compound that is known to form a zwitterion, even if it is not explicitly named in its zwitterionic form. Terms such as zwitterion, zwitterions, and their synonyms zwitterionic compound(s) are standard IUPAC-endorsed names that are well known and part of standard sets of defined scientific names. In this regard, the name zwitterion is assigned the name identification CHEBI:27369 by the Chemical Entities of Biological Interest (ChEBI) dictionary of molecular entities. As is generally well known, a zwitterion or zwitterionic compound is a neutral compound that has formal unit charges of opposite sign. Sometimes these compounds are referred to by the term "inner salts". Other sources refer to these compounds as "dipolar ions", although the latter term is regarded by still other sources as a misnomer. As a specific example, aminoethanoic acid (the amino acid glycine) has the formula H_2NCH_2COOH, and it exists in some media (in this case in neutral media) in the form of the zwitterion $+H_3NCH_2COO-$. Zwitterions, zwitterionic compounds, inner salts, and dipolar ions in the known and well established meanings of these terms are within the scope of this invention, as would in any case be so appreciated by those of ordinary skill in the art. Because there is no need to name each and every embodiment that would be recognized by those of ordinary skill in the art, no structures of the zwitterionic compounds that are associated with the compounds of this invention are given explicitly herein. They are, however, part of the embodiments of this invention. No further examples in this regard are provided herein because the interactions and transformations in a given medium that lead to the various forms of a given compound are known by any one of ordinary skill in the art.

Isotopes may be present in the compounds described. Each chemical element present in a compound either specifically or generically described herein may include any isotope of said element. Any formula given herein is also intended to represent unlabeled forms as well as isotopically labeled forms of the compounds. Isotopically labeled compounds have structures depicted by the formulas given herein except that one or more atoms are replaced by an atom having a selected atomic mass or mass number. Examples of isotopes that can be incorporated into compounds of the invention include isotopes of hydrogen, carbon, nitrogen, oxygen,

phosphorus, fluorine, sulfur, fluorine, chlorine and iodine, such as ^{2}H, ^{3}H, ^{11}C, ^{13}C, ^{14}C, ^{15}N, ^{18}O, ^{17}O, ^{31}P, ^{32}P, ^{35}S, ^{18}F, ^{36}Cl, ^{125}I , respectively.

When referring to any formula given herein, the selection of a particular moiety from a list of possible species for a specified variable is not intended to define the same choice of the species for the variable appearing elsewhere. In other words, where a variable appears more than once, the choice of the species from a specified list is independent of the choice of species for the same variable elsewhere in the formula, unless otherwise stated.

By way of a first example on substituent terminology, if substituent $S^{1}_{example}$ is one of S_1 and S_2, and substituent $S^{2}_{example}$ is one of S_3 and S_4, then these assignments refer to embodiments of this invention given according to the choices $S^{1}_{example}$ is S_1 and $S^{2}_{example}$ is S_3; $S^{1}_{example}$ is S_1 and $S^{2}_{example}$ is S_4; $S^{1}_{example}$ is S_2 and $S^{2}_{example}$ is S_3; $S^{1}_{example}$ is S_2 and $S^{2}_{example}$ is S_4; and equivalents of each one of such choices. The shorter terminology "$S^{1}_{example}$ is one of S_1 and S_2 and "$S^{2}_{example}$ is one of S_3 and S_4 is accordingly used herein for the sake of brevity but not by way of limitation. The foregoing first example on substituent terminology, which is stated in generic terms, is meant to illustrate the various substituent assignments described herein. The foregoing convention given herein for substituents extends, when applicable, to members such as R^1, R^2, R^3, R^4 R^a, R^b, R^c, R^d, R^{d1},R^e, R^{e1},R^f, R^g, R^h, R^j, R^k R^m, R^n and U, Y, Z, HAL, HET and any other generic substituent symbol used herein.

Furthermore, when more than one assignment is given for any member or substituent, embodiments of this invention comprise the various groupings that can be made from the listed assignments, taken independently, and equivalents thereof. By way of a second example on substituent terminology, if it is herein described that substituent $S_{example}$ is one of S_1, S_2 and S_3, the listing refers to embodiments of this invention for which $S_{example}$ is S_1; $S_{example}$ is S_2; $S_{example}$ is S_3; $S_{example}$ is one of S_1 and S_2; $S_{example}$ is one of S_1 and S_3; $S_{example}$ is one of S_2 and S_3; $S_{example}$ is one of S_1, S_2 and S_3; and $S_{example}$ is any equivalent of each one of these choices. The shorter terminology "$S_{example}$ is one of S_1, S_2 and S_3" is accordingly used herein for the sake of brevity, but not by way of limitation. The foregoing second example on substituent terminology, which is stated in generic terms, is meant to illustrate the various substituent assignments described herein. The foregoing convention given herein for substituents extends, when applicable, to members such as R^1, R^2, R^3, R^4 R^a, R^b, R^c, R^d, R^{d1},R^e, R^{e1}, R^f, R^g, R^h, R^j, R^k R^m, R^n and U, Y, Z, HAL, HET and any other generic substituent symbol used herein.

The nomenclature "C_{i-j}" with j > i, when applied herein to a class of substituents, is meant to refer to embodiments of this invention for which each and every one of the number of carbon members, from i to j including i and j, is independently realized. By way of example, the

term C_{1-3} refers independently to embodiments that have one carbon member (C_1), embodiments that have two carbon members (C_2), and embodiments that have three carbon members (C_3).

The term C_{n-m}alkyl refers to an aliphatic chain, whether straight or branched, with the total number N of carbon members in the chain that satisfies $n \leq N \leq m$, with $m > n$.

Any disubstituent referred to herein is meant to encompass the various attachment possibilities when more than one of such possibilities are allowed. For example, reference to disubstituent -A-B-, where $A \neq B$, refers herein to such disubstituent with A attached to a first substituted member and B attached to a second substituted member, and it also refers to such disubstituent with A attached to the second member and B attached to the first substituted member.

According to the foregoing interpretive considerations on assignments and nomenclature, it is understood that explicit reference herein to a set implies, where chemically meaningful and unless indicated otherwise, independent reference to embodiments of such set, and reference to each and every one of the possible embodiments of subsets of the set referred to explicitly.

The term "prodrug" means a precursor of a designated compound that, following administration to a subject, yields the compound *in vivo* via a chemical or physiological process such as solvolysis or enzymatic cleavage, or under physiological conditions (*e.g.*, a prodrug on being brought to physiological pH is converted to the compound of Formula (I)).

A "pharmaceutically acceptable prodrug" is a prodrug that is preferably non-toxic, biologically tolerable, and otherwise biologically suitable for administration to the subject. Illustrative procedures for the selection and preparation of suitable prodrug derivatives are described, for example, in "Design of Prodrugs", ed. H. Bundgaard, Elsevier, 1985.

A "metabolite" means a pharmacologically active product of metabolism in the body of a compound of Formula (I) or salt thereof. Preferably, the metabolite is in an isolated form outside the body.

Compositions

The term "composition," as in pharmaceutical composition, is intended to encompass a product comprising the active ingredient(s), and the inert ingredient(s) (pharmaceutically acceptable excipients) that make up the carrier, as well as any product which results, directly or indirectly, from combination, complexation, or aggregation of any two or more of the ingredients, or from dissociation of one or more of the ingredients, or from other types of reactions or interactions of one or more of the ingredients. Accordingly, the pharmaceutical compositions of the present invention encompass any composition made by admixing a compound of Formula (I) and a pharmaceutically acceptable excipient.

The term "pharmaceutically acceptable," as used in connection with compositions of the invention, refers to molecular entities and other ingredients of such compositions that are physiologically tolerable and do not typically produce untoward reactions when administered to an animal (*e.g.*, human). The term "pharmaceutically acceptable" may also mean approved by a regulatory agency of the Federal or a state government or listed in the U.S. Pharmacopeia or other generally recognized pharmacopeia for use in animals (*e.g.* mammals), and more particularly in humans.

A "pharmaceutically acceptable excipient" refers to a substance that is non-toxic, biologically tolerable, and otherwise biologically suitable for administration to a subject, such as an inert substance, added to a pharmacological composition or otherwise used as a vehicle, carrier, or diluents to facilitate administration of an agent and that is compatible therewith. Examples of excipients include calcium carbonate, calcium phosphate, various sugars and types of starch, cellulose derivatives, gelatin, vegetable oils, and polyethylene glycols. Suitable pharmaceutical carriers include those described in Remington: The Science and Practice of Pharmacy, 21st Ed., Lippincott Williams & Wilkins (2005).

A "pharmaceutically acceptable salt" is intended to mean a salt of a free acid or base of a compound represented by Formula (I) that is non-toxic, biologically tolerable, or otherwise biologically suitable for administration to the subject. See, generally, G.S. Paulekuhn et al., Trends in Active Pharmaceutical Ingredient Salt Selection based on Analysis of the Orange Book Database, *J. Med. Chem.* 2007, *50*, 6665-6672; Berge et al., Pharmaceutical Salts, *J. Pharm. Sci.* 1977, *66*, 1-19; Stahl and Wermuth (eds), Pharmaceutical Salts; Properties, Selection, and Use: 2nd Revised Edition, Wiley-VCS, Zurich, Switzerland (2011). Examples of pharmaceutically acceptable salts are those that are pharmacologically effective and suitable for contact with the tissues of patients without undue toxicity, irritation, or allergic response. A compound of Formula (I) may possess a sufficiently acidic group, a sufficiently basic group, or both types of functional groups, and accordingly react with a number of inorganic or organic bases, and inorganic and organic acids, to form a pharmaceutically acceptable salt bases, and inorganic and organic acids, to form a pharmaceutically acceptable salt.

The term "carrier" refers to an adjuvant, vehicle, or excipients, with which the compound is administered. In preferred embodiments of this invention, the carrier is a solid carrier. Suitable pharmaceutical carriers include those described in Remington: The Science and Practice of Pharmacy, 21st Ed., Lippincott Williams & Wilkins (2005).

The term "dosage form," as used herein, is the form in which the dose is to be administered to the subject or patient. The drug is generally administered as part of a formulation that includes nonmedical agents. The dosage form has unique physical and

pharmaceutical characteristics. Dosage forms, for example, may be solid, liquid or gaseous. "Dosage forms" may include, for example, a capsule, tablet, caplet, gel caplet (gelcap), syrup, a liquid composition, a powder, a concentrated powder, a concentrated powder admixed with a liquid, a chewable form, a swallowable form, a dissolvable form, an effervescent, a granulated form, and an oral liquid solution. In a specific embodiment, the dosage form is a solid dosage form, and more specifically, comprises a tablet or capsule.

As used herein, the term "inert" refer to any inactive ingredient of a described composition. The definition of "inactive ingredient" as used herein follows that of the U.S. Food and Drug Administration, as defined in 21 C.F.R. 201.3(b)(8), which is any component of a drug product other than the active ingredient.

Methods and Uses

As used herein, the term "disorder" is used interchangeably with "disease" or "condition". For example, a CNS disorder also means a CNS disease or a CNS condition.

As used herein, the term "cognitive impairment" is used interchangeably with "cognitive dysfunction" or "cognitive deficit," all of which are deemed to cover the same therapeutic indications.

The terms "treating," "treatment," and "treat" cover therapeutic methods directed to a disease-state in a subject and include: (i) preventing the disease-state from occurring, in particular, when the subject is predisposed to the disease-state but has not yet been diagnosed as having it; (ii) inhibiting the disease-state, *e.g.*, arresting its development (progression) or delaying its onset; and (iii) relieving the disease-state, *e.g.*, causing regression of the disease state until a desired endpoint is reached. Treating also includes ameliorating a symptom of a disease (*e.g.,* reducing the pain, discomfort, or deficit), wherein such amelioration may be directly affecting the disease (*e.g.*, affecting the disease's cause, transmission, or expression) or not directly affecting the disease.

As used in the present disclosure, the term "effective amount" is interchangeable with "therapeutically effective amount" and means an amount or dose of a compound or composition effective in treating the particular disease, condition, or disorder disclosed herein, and thus "treating" includes producing a desired preventative, inhibitory, relieving, or ameliorative effect. In methods of treatment according to the invention, "an effective amount" of at least one compound according to the invention is administered to a subject (*e.g.*, a mammal). An "effective amount" also means an amount or dose of a compound or composition effective to modulate activity of PDE4 or an associated signaling pathway, such as the CREB pathway and thus produce the desired modulatory effect. The "effective amount" will vary, depending on the compound, the disease, the type of treatment desired, and its severity, and age, weight, etc.

The term "animal" is interchangeable with "subject" and may be a vertebrate, in particular, a mammal, and more particularly, a human, and includes a laboratory animal in the context of a clinical trial or screening or activity experiment. Thus, as can be readily understood by one of ordinary skill in the art, the compositions and methods of the present invention are particularly suited to administration to any vertebrate, particularly a mammal, and more particularly, a human.

As used herein, a "control animal" or a "normal animal" is an animal that is of the same species as, and otherwise comparable to (*e.g.*, similar age, sex), the animal that is trained under conditions sufficient to induce transcription-dependent memory formation in that animal.

By "enhance," "enhancing," or "enhancement" is meant the ability to potentiate, increase, improve or make greater or better, relative to normal, a biochemical or physiological action or effect. For example, enhancing long term memory formation refers to the ability to potentiate or increase long term memory formation in an animal relative to the normal long term memory formation of the animal or controls. As a result, long term memory acquisition is faster or better retained. Enhancing performance of a cognitive task refers to the ability to potentiate or improve performance of a specified cognitive task by an animal relative to the normal performance of the cognitive task by the animal or controls.

As used herein, the term "training protocol," or "training," refers to either "cognitive training" or "motor training." The phrase "in conjunction" means that a compound or composition of the present invention enhances CREB pathway function during cognitive or motor training.

Reference will now be made to the embodiments of the present invention, examples of which are illustrated by and described in conjunction with the accompanying drawings and examples. While certain embodiments are described herein, it is understood that the described embodiments are not intended to limit the scope of the invention. On the contrary, the present disclosure is intended to cover alternatives, modifications, and equivalents that can be included within the invention as defined by the appended claims.

Isotopically-Labeled Compounds

The invention also includes isotopically-labeled compounds, which are identical to those recited in Formula I, but for the fact that one or more atoms are replaced by an atom having an atomic mass or mass number different from the atomic mass or mass number usually found in nature. Examples of isotopes that can be incorporated into compounds of the invention include isotopes of carbon, chlorine, fluorine, hydrogen, iodine, nitrogen, oxygen, phosphorous, sulfur, and technetium, including ^{11}C, ^{13}C, ^{14}C, ^{36}Cl, ^{18}F, ^{2}H, ^{3}H, ^{123}I, ^{125}I, ^{13}N, ^{15}N, ^{15}O, ^{17}O, ^{18}O, ^{31}P, ^{32}P, ^{35}S, and ^{99m}Tc.

other isotopes of other atoms are within the scope of the invention. Isotopically-labeled compounds of the present invention are useful in drug and substrate tissue distribution and target occupancy assays. For example, isotopically labeled compounds are particularly useful in SPECT (single photon emission computed tomography) and in PET (positron emission tomography), as discussed further herein.

Accordingly, in one embodiment the invention includes pharmaceutically acceptable salts of the compounds represented by Formula (I), and methods using such salts.

Examples of pharmaceutically acceptable salts include sulfates, pyrosulfates, bisulfates, sulfites, bisulfites, phosphates, monohydrogen-phosphates, dihydrogenphosphates, metaphosphates, pyrophosphates, chlorides, bromides, iodides, acetates, borate, nitrate, propionates, decanoates, caprylates, acrylates, formates, isobutyrates, caproates, heptanoates, propiolates, oxalates, malonates, succinates, suberates, sebacates, fumarates, maleates, butyne-1,4-dioates, hexyne-1,6-dioates, benzoates, chlorobenzoates, methylbenzoates, dinitrobenzoates, hydroxybenzoates, methoxybenzoates, phthalates, sulfonates, xylenesulfonates, phenylacetates, phenylpropionates, phenylbutyrates, citrates, lactates, y-hydroxybutyrates, glycolates, tartrates, methane-sulfonates, propanesulfonates, naphthalene-1-sulfonates, naphthalene-2-sulfonates, besylate, mesylate and mandelates.

Solvates

In other embodiments, the invention provides a solvate of a compound of Formula (I), and the use of such solvates in methods of present invention. Certain compounds of Formula (I) or pharmaceutically acceptable salts of compounds of Formula (I) may be obtained as solvates. In some embodiments, the solvent is water and the solvates are hydrates.

More particularly, solvates include those formed from the interaction or complexes of compounds of the invention with one or more solvents, either in solution or as a solid or crystalline form. Such solvent molecules are those commonly used in the pharmaceutical art, which are known to be innocuous to the recipient, *e.g.*, water, ethanol, ethylene glycol, and the like. Other solvents may be used as intermediate solvates in the preparation of more desirable solvates, such as MeOH, methyl *t*-butyl ether, ethyl acetate, methyl acetate, (*S*)-propylene glycol, (*R*)-propylene glycol, 1,4-butyne-diol, and the like. Hydrates include compounds formed by an incorporation of one or more water molecules.

Conformers and Crystalline Forms/Polymorphs

In other embodiments, the invention provides conformer and crystalline form of a compound of Formula (I), and the use of these derivatives in methods of present invention. A conformer is a structure that is a conformational isomer. Conformational isomerism is the phenomenon of molecules with the same structural formula but different conformations (conformers) of atoms about a rotating bond.

A polymorph is a composition having the same chemical formula, but a different solid state or crystal structure. In certain embodiments of the invention, compounds of Formula (I)

were obtained in crystalline form. In addition, certain crystalline forms of compounds of Formula (I) or pharmaceutically acceptable salts of compounds of Formula (I) may be obtained as co-crystals. In still other embodiments, compounds of Formula (I) may be obtained in one of several polymorphic forms, as a mixture of crystalline forms, as a polymorphic form, or as an amorphous form.

Prodrugs

The invention also relates to prodrugs of the compounds of Formula (I), and the use of such pharmaceutically acceptable prodrugs in methods of the present invention, particularly therapeutic methods. Exemplary prodrugs include compounds having an amino acid residue, or a polypeptide chain of two or more (*e.g.*, two, three or four) amino acid residues, covalently joined through an amide or ester bond to a free amino, hydroxy, or carboxylic acid group of a compound of Formula (I). Examples of amino acid residues include the twenty naturally occurring amino acids, commonly designated by three letter symbols, as well as 4-hydroxyproline, hydroxylysine, demosine, isodemosine, 3-methylhistidine, norvalin, beta-alanine, gamma-aminobutyric acid, citrulline homocysteine, homoserine, ornithine and methionine sulfone.

Additional types of prodrugs may be produced, for instance, by derivatizing free carboxyl groups of structures of Formula (I) as amides or alkyl esters. Examples of amides include those derived from ammonia, primary C_{1-6}alkyl amines and secondary di(C_{1-6}alkyl) amines. Secondary amines include 5- or 6-membered heterocycloalkyl or heteroaryl ring moieties. Examples of amides include those that are derived from ammonia, C_{1-3}alkyl primary amines, and di(C_{1-2}alkyl)amines. Examples of esters of the invention include C_{1-6}alkyl, C_{1-6}cycloalkyl, phenyl, and phenyl(C_{1-6}alkyl) esters. Preferred esters include methyl esters. Prodrugs may also be prepared by derivatizing free hydroxy groups using groups including hemisuccinates, phosphate esters, dimethylaminoacetates, and phosphoryloxymethyloxycarbonyls, following procedures such as those outlined in Fleisher et al., *Adv. Drug Delivery Rev.* 1996, *19*, 115-130.

Carbamate derivatives of hydroxy and amino groups may also yield prodrugs. Carbonate derivatives, sulfonate esters, and sulfate esters of hydroxy groups may also provide prodrugs. Derivatization of hydroxy groups as (acyloxy)methyl and (acyloxy)ethyl ethers, wherein the acyl group may be an alkyl ester, optionally substituted with one or more ether, amine, or carboxylic acid functionalities, or where the acyl group is an amino acid ester as described above, is also useful to yield prodrugs. Prodrugs of this type may be prepared as described in Robinson et al., *J. Med. Chem.* 1996, *39*, 10-18. Free amines can also be derivatized as amides,

sulfonamides or phosphonamides. All of these prodrug moieties may incorporate groups including ether, amine, and carboxylic acid functionalities.

Prodrugs may be determined using routine techniques known or available in the art (*e.g.*, Bundgard (ed.), 1985, Design of prodrugs, Elsevier; Krogsgaard-Larsen et al., (eds.), 1991, Design and Application of Prodrugs, Harwood Academic Publishers).

Metabolites

The present invention also relates to a metabolite of a compound of Formula (I), as defined herein, and salts thereof. The present invention further relates to the use of such metabolites, and salts thereof, in methods of present invention, including therapeutic methods.

Metabolites of a compound may be determined using routine techniques known or available in the art. For example, isolated metabolites can be enzymatically and synthetically produced (*e.g.*, Bertolini et al., *J. Med. Chem.* 1997, *40*, 2011-2016; Shan et al., *J. Pharm. Sci.* 1997, *86*, 765-767; Bagshawe, *Drug Dev. Res.* 1995, *34*, 220-230; and Bodor, *Adv Drug Res.* 1984, *13*, 224-231).

COMPOSITIONS

In some embodiments Compounds of Formula (I) and pharmaceutically acceptable salts thereof are used, alone or in combination with one or more additional active ingredients, to formulate pharmaceutical compositions. A pharmaceutical composition of the invention comprises: (a) an effective amount of at least one active agent in accordance with the invention; and (b) a pharmaceutically acceptable excipient.

Formulations and Administration

Numerous standard references are available that describe procedures for preparing various formulations suitable for administering the compounds according to the invention. Examples of potential formulations and preparations are contained, for example, in the Handbook of Pharmaceutical Excipients, American Pharmaceutical Association (current edition); Pharmaceutical Dosage Forms: Tablets (Lieberman, Lachman and Schwartz, editors) current edition, published by Marcel Dekker, Inc., as well as Remington's Pharmaceutical Sciences (Osol, ed.),1980, 1553-1593.

Any suitable route of administration may be employed for providing an animal, especially a human, with an effective dosage of a compound of the present invention. For example, oral, rectal, topical, parenteral, ocular, pulmonary, nasal, and the like may be employed. Dosage forms include tablets, troches, dispersions, suspensions, solutions, capsules, creams, ointments, aerosols, and the like.

Suitable carriers, diluents and excipients are well known to those skilled in the art and include materials such as carbohydrates, waxes, water soluble and/or swellable polymers,

hydrophilic or hydrophobic materials, gelatin, oils, solvents, water, and the like. The particular carrier, diluent, or excipient used will depend upon the means and purpose for which the compound of the present invention is being applied. Solvents are generally selected based on solvents recognized by persons skilled in the art as safe (GRAS) to be administered to an animal. In general, safe solvents are non-toxic aqueous solvents such as water and other non-toxic solvents that are soluble or miscible in water. Suitable aqueous solvents include water, ethanol, propylene glycol, polyethylene glycols (*e.g.*, PEG400, PEG300), etc. and mixtures thereof. The formulations may also include one or more buffers, stabilizing agents, surfactants, wetting agents, lubricating agents, emulsifiers, suspending agents, preservatives, antioxidants, opaquing agents, glidants, processing aids, colorants, sweeteners, perfuming agents, flavoring agents and other known additives to provide an elegant presentation of the drug (*i.e.*, a compound of the present invention or pharmaceutical composition thereof) or aid in the manufacturing of the pharmaceutical product (*i.e.*, medicament).

The formulations may be prepared using conventional dissolution and mixing procedures. For example, the bulk drug substance (*i.e.*, a compound of the present invention or stabilized form of the compound (*e.g.*, complex with a cyclodextrin derivative or other known complexation agent)) is dissolved in a suitable solvent in the presence of one or more of the excipients described above. The compound of the present invention is typically formulated into pharmaceutical dosage forms to provide an easily controllable and appropriate dosage of the drug.

The pharmaceutical composition (or formulation) for application may be packaged in a variety of ways, depending upon the method used to administer the drug. Generally, an article for distribution includes a container having deposited therein the pharmaceutical formulation in an appropriate form. Suitable containers are well-known to those skilled in the art and include materials such as bottles (plastic and glass), sachets, ampoules, plastic bags, metal cylinders, and the like. The container may also include a tamper-proof assemblage to prevent indiscreet access to the contents of the package. In addition, the container has deposited thereon a label that describes the contents of the container. The label may also include appropriate warnings.

The present compounds may be systemically administered, *e.g.*, orally, in combination with a pharmaceutically acceptable vehicle such as an inert diluent or an assimilable edible carrier. They may be enclosed in hard or soft shell gelatin capsules, may be compressed into tablets, or may be incorporated directly with the food of the patient's diet. For oral therapeutic administration, the active compound may be combined with one or more excipients and used in the form of ingestible tablets, buccal tablets, troches, capsules, elixirs, suspensions, syrups, wafers, and the like. Such compositions and preparations should contain at least 0.1% of active

compound. The percentage of the compositions and preparations may, of course, be varied and may conveniently be between about 2 to about 60% of the weight of a given unit dosage form. The amount of active compound in such therapeutically useful compositions is such that an effective dosage level will be obtained.

The tablets, troches, pills, capsules, and the like may also contain the following: binders such as gum tragacanth, acacia, corn starch or gelatin; excipients such as dicalcium phosphate; a disintegrating agent such as corn starch, potato starch, alginic acid and the like; a lubricant such as magnesium stearate; and a sweetening agent such as sucrose, fructose, lactose or aspartame or a flavoring agent such as peppermint, oil of wintergreen, or cherry flavoring may be added. When the unit dosage form is a capsule, it may contain, in addition to materials of the above type, a liquid carrier, such as a vegetable oil or a polyethylene glycol. Various other materials may be present as coatings or to otherwise modify the physical form of the solid unit dosage form. For instance, tablets, pills, or capsules may be coated with gelatin, wax, shellac or sugar and the like. A syrup or elixir may contain the active compound, sucrose or fructose as a sweetening agent, methyl and propylparabens as preservatives, a dye and flavoring such as cherry or orange flavor. Of course, any material used in preparing any unit dosage form should be pharmaceutically acceptable and substantially non-toxic in the amounts employed. In addition, the active compound may be incorporated into sustained-release preparations and devices.

The active compound may also be administered intravenously or intraperitoneally by infusion or injection. Solutions of the active compound or its salts can be prepared in water, optionally mixed with a nontoxic surfactant. Dispersions can also be prepared in glycerol, liquid polyethylene glycols, triacetin, and mixtures thereof and in oils. Under ordinary conditions of storage and use, these preparations contain a preservative to prevent the growth of microorganisms.

The pharmaceutical dosage forms suitable for injection or infusion can include sterile aqueous solutions or dispersions or sterile powders comprising the active ingredient which are adapted for the extemporaneous preparation of sterile injectable or infusible solutions or dispersions, optionally encapsulated in liposomes. In all cases, the ultimate dosage form should be sterile, fluid, and stable under the conditions of manufacture and storage. The liquid carrier or vehicle can be a solvent or liquid dispersion medium comprising, for example, water, ethanol, a polyol (for example, glycerol, propylene glycol, liquid polyethylene glycols, and the like), vegetable oils, nontoxic glyceryl esters, and suitable mixtures thereof. The proper fluidity can be maintained, for example, by the formation of liposomes, by the maintenance of the required particle size in the case of dispersions or by the use of surfactants. The prevention of the action

of microorganisms can be brought about by various antibacterial and antifungal agents, for example, parabens, chlorobutanol, phenol, sorbic acid, thimerosal, and the like. In many cases, it will be preferable to include isotonic agents, for example, sugars, buffers or sodium chloride. Prolonged absorption of the injectable compositions can be brought about by the use in the compositions of agents delaying absorption, for example, aluminum monostearate and gelatin.

Sterile injectable solutions are typically prepared by incorporating the active compound in the required amount in the appropriate solvent with a variety of the other ingredients enumerated above, as required, followed by filter sterilization. In the case of sterile powders for the preparation of sterile injectable solutions, common methods of preparation are vacuum drying and the freeze drying techniques, which yield a powder of the active ingredient plus any additional desired ingredient present in the previously sterile-filtered solutions.

For topical administration, the present compounds may be applied in pure form, *i.e.*, when they are liquids. However, it will generally be desirable to administer them to the skin as compositions or formulations, in combination with a dermatologically acceptable carrier, which may be a solid or a liquid.

Useful solid carriers include finely divided solids such as talc, clay, microcrystalline cellulose, silica, alumina, and the like. Useful liquid carriers include water, alcohols or glycols or water-alcohol/glycol blends, in which the present compounds can be dissolved or dispersed at effective levels, optionally with the aid of non-toxic surfactants. Adjuvants such as fragrances and additional antimicrobial agents can be added to optimize the properties for a given use. The resultant liquid compositions can be applied from absorbent pads, used to impregnate bandages and other dressings, or sprayed onto the affected area using pump-type or aerosol sprayers.

Thickeners such as synthetic polymers, fatty acids, fatty acid salts and esters, fatty alcohols, modified celluloses or modified mineral materials can also be employed with liquid carriers to form spreadable pastes, gels, ointments, soaps, and the like, for application directly to the skin of the user.

Dosages

Useful dosages of the compounds of Formula (I) can be determined by comparing their *in vitro* activity and *in vivo* activity in animal models. Methods for the extrapolation of effective dosages in mice, and other animals, to humans are known to the art. Useful dosages of the compounds of formula I can be determined by comparing their in vitro activity, and *in vivo* activity in animal models. Methods for the extrapolation of effective dosages in mice, and other animals, to humans are known to the art (*e.g.*, U.S. Pat. No. 4,938,949). Useful dosages of PDE4 inhibitors are known to the art (*e.g.*, U.S. Pat. No. 7,829,713; U.S. Pat. No. 8,338,405).

Optimal dosages to be administered in the therapeutic methods of the present invention may be determined by those skilled in the art and will depend on multiple factors, including the particular composition in use, the strength of the preparation, the mode and time of administration, and the advancement of the disease or condition. Additional factors may include characteristics on the subject being treated, such as age, weight, gender, and diet.

In general, however, a suitable dose will be in the range from about 0.01 to about 100 mg/kg, more specifically, from about 0.1 to about 100 mg/kg, such as 10 to about 75 mg/kg of body weight per day, 3 to about 50 mg per kilogram body weight of the recipient per day, 0.5 to 90 mg/kg/day, or 1 to 60 mg/kg/day (or any other value or range of values therein). The compound is conveniently administered in a unit dosage form; for example, containing about 1 to 1000 mg, particularly about 10 to 750 mg, and more particularly, about 50 to 500 mg of active ingredient per unit dosage form.

Preferably, the active ingredient should be administered to achieve peak plasma concentrations of the active compound of from about 0.5 to about 75 μM, preferably, about 1 to 50 μM, and more preferably, about 2 to about 30 μM. This may be achieved, for example, by the intravenous injection of a 0.05 to 5% solution of the active ingredient, optionally in saline, or orally administered as a bolus containing about 1 to 100 mg of the active ingredient. Desirable blood levels may be maintained by continuous infusion to provide about 0.01 to 5.0 mg/kg/hr or by intermittent infusions containing about 0.4 to 15 mg/kg of the active ingredient(s).

The desired dose may conveniently be presented in a single dose or as divided doses administered at appropriate intervals, for example, as two, three, four or more sub-doses per day. The sub-dose itself may be further divided, *e.g.*, into a number of temporally-distinct administrations used according to the compositions and methods of the present invention.

Effective amounts or doses of the active agents of the present invention may be ascertained by routine methods such as modeling, dose escalation studies or clinical trials, and by taking into consideration routine factors, *e.g.*, the mode or route of administration or drug delivery, the pharmacokinetics of the agent, the severity and course of the disease, disorder, or condition, the subject's previous or ongoing therapy, the subject's health status and response to drugs, and the judgment of the treating physician. Such compositions and preparations should contain at least 0.1% of active compound. The percentage of the compositions and preparations may, of course, be varied and may conveniently be between 2 to about 60% of the weight of a given unit dosage form. The amount of active compound in such therapeutically useful composition is such that an effective dosage level will be obtained. An exemplary dose is in the range from about 0.001 to about 200 mg of active agent per kg of subject's body weight per day, preferably about 0.05 to 100 mg/kg/day, or about 1 to 35 mg/kg/day, or about 0.1 to 10

mg/kg/daily in single or divided dosage units (*e.g.*, BID, TID, QID). For a 70-kg human, an illustrative range for a suitable dosage amount is from 1 to 200 mg/day, or about 5 to 50 mg/day.

Methods and Uses

Uses of Isotopically-Labeled Compounds

In one aspect, the present invention provides a method of using isotopically labeled compounds and prodrugs of the present invention in: (i) metabolic studies (preferably with ^{14}C), reaction kinetic studies (with, for example ^{2}H or ^{3}H); (ii) detection or imaging techniques [such as positron emission tomography (PET) or single-photon emission computed tomography (SPECT)] including drug or substrate tissue distribution assays; or (iii) in radioactive treatment of patients.

Isotopically labeled compounds and prodrugs of the invention thereof can generally be prepared by carrying out the procedures disclosed in the schemes or in the examples and preparations described below by substituting a readily available isotopically labeled reagent for a non-isotopically labeled reagent. An ^{18}F or ^{11}C labeled compound may be particularly preferred for PET, and an I^{123} labeled compound may be particularly preferred for SPECT studies. Further substitution with heavier isotopes such as deuterium (*i.e.*, ^{2}H) may afford certain therapeutic advantages resulting from greater metabolic stability, for example increased *in vivo* half-life or reduced dosage requirements.

In one aspect, the compounds of the present invention are useful in enhancing neuronal plasticity – an essential property of the brain that can be augmented in healthy animals and can be impaired in numerous CNS disorders. For example, by inhibiting PDE4, a compound of the present invention can increase levels of cAMP, modulating cyclic nucleotide signaling cascades.

More particularly, the ability of extracellular signals to modulate the intracellular concentration of cyclic nucleotides allows cells to respond to external stimuli across the boundary of the cell membrane. The cyclic nucleotide signaling cascades have been adapted to respond to a host of transduction systems including G-protein coupled receptors (GPCRs) and voltage and ligand gated ion channels. Cyclic nucleotides transmit their signal in the cell through a variant of tertiary elements. The best described of these are cAMP dependent protein kinase (PKA) and cGMP dependent protein kinase (PKG). The binding of the cyclic nucleotide to each enzyme enables the phosphorylation of downstream enzymes and proteins functioning as effectors or additional elements in the signaling cascade. Of particular importance to memory formation is cAMP-dependent activation of PKA, which phosphorylates CREB. pCREB is an activated transcription factor, which binds to specific DNA loci and initiates transcription of multiple genes involved in neuronal plasticity (*e.g.*,Tully et al., *Nat. Rev. Drug. Discov.* 2003, *2*, 267-277; and Alberini, *Physiol. Rev.* 2009, *89*, 121-145).

Consistent with these observations, both *in vitro* and *in vivo* studies have associated alterations in cyclic nucleotide concentrations with biochemical and physiological process linked to cognitive function (Kelly and Brandon, *Progress in Brain Research*, 2009, 179, 67-73; Schmidt, *Current Topics in Medicinal Chemistry,* 2010, 10, 222-230). Moreover, signal intensity and the levels of coincident activity at a synapse are established variables that can result in potentiation of transmission at a particular synapse. Long term potentiation (LTP) is the best described of these processes and is known to be modulated by both the cAMP and cGMP signaling cascades.

Accordingly, the present invention provides a method of enhancing neuronal plasticity, comprising administering to an animal in need thereof an effective amount of a chemical entity or composition of the present invention.

Neurological disorders include structural, biochemical, or electrical abnormalities in the brain, spinal cord or other nerves, abnormalities that can result in a range of symptoms. Examples of such symptoms include paralysis, muscle weakness, poor coordination, loss of sensation, seizures, confusion, pain, altered levels of consciousness, and cognitive deficits, including memory impairments. There are many recognized neurological disorders, some relatively common, but many rare. They may be assessed by neurological examination, and studied and treated within the specialties of neurology and clinical neuropsychology.

Neurological disorders and their sequelae (direct consequences) affect as many as one billion people worldwide, as estimated by the World Health Organization in 2006. Interventions for neurological disorders may include, in addition to medications, preventative measures, lifestyle changes, physiotherapy or other therapies, neurorehabilitation, pain management, and surgery.

The utility of PDE4 inhibitors in the treatment of sleep disorders is known in the literature.

In other embodiments, the sleep disorder is restless leg syndrome. Restless legs syndrome (RLS) is a disorder of the part of the nervous system that affects the legs and causes an urge to move them. People with restless legs syndrome have uncomfortable sensations in their legs (and sometimes arms or other parts of the body) and an irresistible urge to move their legs to relieve the sensations. The sensations are usually worse at rest, especially when lying or sitting. The sensations can lead to sleep deprivation and stress. Because it usually interferes with sleep, it also is considered a sleep disorder. Accordingly, the present invention provides a method of treating restless leg syndrome, comprising administering to an animal in need thereof an effective amount of a compound or composition of the present invention.

In a specific embodiment, the invention provides a method of treating Alzheimer's disease, comprising administering to an animal in need of such treatment an effective amount of a compound or pharmaceutical composition described herein. A detailed set of criteria for the diagnosis of Alzheimer's is set forth in the Diagnostic and Statistical Manual of Mental Disorders (Fourth Edition, text revision (2000), also known as the DSM-IV-TR). First, multiple cognitive deficits must be present, one of which must be memory impairment. Second, one or more of the following must be present: aphasia (deterioration of language abilities); apraxia (difficulty executing motor activities – even though movement, senses, and the ability to understand what is being asked are still intact); or agnosia (impaired ability to recognize or identify objects – even though sensory abilities are intact).

Amyotrophic Lateral Sclerosis

In another specific embodiment, the invention provides a method of treating amyotrophic lateral sclerosis, comprising administering to an animal in need of such treatment an effective amount of a compound or pharmaceutical composition described herein.

Amyotrophic lateral sclerosis (ALS), often referred to as "Lou Gehrig's Disease," is a progressive neurodegenerative disease that affects nerve cells. Motor neurons reach from the brain to the spinal cord and from the spinal cord to the muscles throughout the body. As motor neurons degenerate, they can no longer send impulses to the muscle fibers that normally result in muscle movement.

Early symptoms of ALS often include increasing muscle weakness, especially involving the arms and legs, speech, swallowing or breathing. The progressive degeneration of the motor neurons in ALS eventually leads to their death. When the motor neurons die, the ability of the brain to initiate and control muscle movement is lost. With voluntary muscle action progressively affected, patients in the later stages of the disease may become totally paralyzed.

Movement Disorders

In other embodiments, the invention provides a method of treating a movement disorder, comprising administering to an animal in need of such treatment an effective amount of a compound or pharmaceutical composition described herein. In one aspect, the movement disorder includes one or more of the following: Huntington's disease, Parkinson's disease, an essential tremor, a Lewy body disease, hypokinetic disease, Multiple Sclerosis, various types of Peripheral Neuropathy, dystonia, a basal ganglia disorder, hypokinesia (including akinesia), and dyskinesia. In addition, Tourette's syndrome and other tic disorders can be included as categories of movement disorders. The utility of PDE4 inhibitors in the treatment of movement disorders is known in the literature.

In related embodiment, the invention provides a method of treating chorea, comprising administering to an animal in need of such treatment an effective amount of a compound or pharmaceutical composition described herein. Chorea can occur in a variety of conditions and disorders, and is a primary feature of Huntington's disease, a progressive neurological disorder.

Huntington's Disease

In a specific embodiment, the present invention provides a method of treating Huntington's disease, comprising administering to an animal in need of such treatment an effective amount of a compound or pharmaceutical composition described herein.

Huntington's Disease (HD, or Huntington chorea) is a disorder passed down through families in which nerve cells in certain parts of the brain waste away, or degenerate. It is caused by a genetic defect on chromosome 4, causing a CAG repeat, to occur many more times than

normal. The CAG element is normally repeated 10 to 28 times, but in persons with Huntington's disease, is repeated 36 to 120 times.

There are two forms of Huntington's disease: adult-onset Huntington's disease – which is the most common form and usually begins in the mid 30s and 40s; and early-onset Huntington's disease, which accounts for a small number of cases and begins in childhood or adolescence.

Symptoms of Huntington's disease include behavioral changes, abnormal and unusual movements, and worsening dementia. Behavioral changes may include behavioral disturbances, hallucinations, irritability, moodiness, restlessness or fidgeting, paranoia, and psychosis. Abnormal and unusual movements include facial movements, such as grimaces; head turning to shift eye position; quick, sudden, sometimes wild jerking movements of the arms, legs, face, and other body parts; slow, uncontrolled movements; and unsteady gait. Worsening dementia includes; disorientation or confusion; loss of judgment; loss of memory; personality changes; and speech changes (*e.g.*, Dumas et al., *Front Biosci* (Schol Ed) 2013, *5*, 1-18). The utility of PDE4 inhibitors in treating Huntington's disease is known in the art.

Parkinson's Disease

In a specific embodiment, the present invention provides a method of treating Parkinson's disease, comprising administering to an animal in need of such treatment an effective amount of a compound or pharmaceutical composition described herein.

In another embodiment, the invention provides a method of treating myoclonus, Gilles de Ia Tourette' s syndrome, dystonia, or tics, comprising administering to an animal in need of such treatment an effective amount of a compound or pharmaceutical composition described herein. The utility of PDE4 inhibitors in the treatment of myoclonus, Tourette's syndrome, dystonia and tics is known in the literature.

In a specific aspect, a movement disorder also includes multiple sclerosis, basal ganglia disorders, hypokinesia, and dyskinesia.

Lewy Body Diseases

In one embodiment, the present embodiment, the invention provides a method of treating a Lewy Body Disease, comprising administering to an animal in need of such treatment an effective amount of a compound or composition of the present invention. Lewy bodies appear as spherical masses that displace other cell components. The two morphological types are classical (brain stem) Lewy bodies and cortical Lewy bodies. A classical Lewy body is an eosinophilic cytoplasmic inclusion consisting of a dense core surrounded by a halo of 10-nm-wide radiating fibrils, the primary structural component of which is alpha-synuclein. In contrast,

a cortical Lewy body is less well defined and lacks the halo. Nonetheless, it is still made up of alpha-synuclein fibrils. Cortical Lewy bodies are a distinguishing feature of Dementia with Lewy bodies (DLB), but may occasionally be seen in ballooned neurons characteristic of Pick's disease and corticobasal degeneration, as well as in patients with other tauopathies.

More particularly, the Lewy Body disorder is selected from the group consisting of multiple system atrophy, particularly the Parkinsonian variant; Parkinson disease without or with dementia (PDD); dementia with LBs (DLB) alone or in association with Alzheimer disease (AD); multiple system atrophy, particularly the Parkinsonian variant, as well as Pick's disease and corticobasal degeneration.

Multiple sclerosis

In one embodiment, the present invention provides a method of treating a motor symptom associated with multiple sclerosis (MS), compring administering to animal in need of such treatment an effective amount of a compound or composition of the present invention. MS is an autoimmune, demyelinating disease that affects the brain and spinal cord of the CNS. It affects women more than men and is most commonly diagnosed between ages 20 and 40, but can be seen at any age.

MS is caused by damage to the myelin sheath, the protective covering that surrounds nerve cells. When this nerve covering is damaged, nerve signals slow down or stop. Because nerves in any part of the brain or spinal cord may be damaged, patients with multiple sclerosis can have symptoms in many parts of the body. Symptoms vary, because the location and severity of each attack can be different. Episodes can last for days, weeks, or months. These episodes alternate with periods of reduced or no symptoms (remissions).

Muscle symptoms associated with MS include loss of balance; muscle spasms; numbness, tingling, or abnormal sensation in any area; problems moving arms or legs; problems walking; problems with coordination and making small movements; tremor in one or more arms or legs; and weakness in one or more arms or legs.

Basal Ganglia Disorders

In particular embodiments, the present invention provides a method of treating a basal ganglia disorder. Basal ganglia disorders refer to a group of physical dysfunctions that occur when the group of nuclei in the brain known as the basal ganglia fail to properly suppress unwanted movements or to properly prime upper motor neuron circuits to initiate motor function (Leisman and Mello, *Rev. Neurosci.* 2013, 24, 9-25).

Increased output of the basal ganglia inhibits thalamocortical projection neurons. Proper activation or deactivation of these neurons is an integral component for proper movement. If something causes too much basal ganglia output, then the thalamocortical projection neurons

become too inhibited and one cannot initiate voluntary movement. These disorders are known as ***hypokinetic*** disorders. However, a disorder leading to abnormally low output of the basal ganglia leads to relatively no inhibition of the thalamocortical projection neurons. This situation leads to an inability to suppress unwanted movements. These disorders are known as ***hyperkinetic*** disorders (Wichmann and DeLong, *Curr. Opin. Neurobiol* 1996, *6*, 751-758).

Hypokinesia

In particular embodiments, the present invention provides a method of treating hypokinesia. Hypokinesia refers to decreased bodily movements, and they may be associated with basal ganglia diseases (such as Parkinson's disease), mental health disorders and prolonged inactivity due to illness, amongst other diseases.

More generally, hypokinesia describes a spectrum of disorders, including: (i) Akinesia, which refers to the inability to initiate movement due to difficulty selecting or activating motor programs in the central nervous system. Akinesia is a result of severely diminished dopaminergic cell activity in the direct pathway of movement and is common in severe cases of Parkinson's disease; (ii) Bradykinesia, which is characterized by slowness of movement and has been linked to Parkinson's disease and other disorders of the basal ganglia. Rather than being a slowness in initiation (akinesia), bradykinesia describes a slowness in the execution of movement. It is one of the 3 key symptoms of parkinsonism, which are bradykinesia, tremor and rigidity. Bradykinesia is also the cause of what is normally referred to as "stone face" (expressionless face) among those with Parkinson's; (iii) Freezing, which is characterized by an inability to move muscles in any desired direction; and (iv) Rigidity, which is characterized by an increase in muscle tone causing resistance to externally imposed joint movements; and (v) Postural instability, which is the loss of ability to maintain an upright posture.

Dyskinesia

In particular embodiments, the present invention provides a method of treating dyskinesia. Dyskinesia is a movement disorder which consists of adverse effects including diminished voluntary movements and the presence of involuntary movements, similar to tics or chorea.

Dyskinesia can be anything from a slight tremor of the hands to uncontrollable movement of, most commonly, the upper body but can also be seen in the lower extremities. Discoordination can also occur internally especially with the respiratory muscles and it often goes unrecognized. Dyskinesia is a symptom of several medical disorders, distinguished by the underlying cause and generally corresponding to one of three types: acute dyskinesia, chronic (or tardive) dyskinesia, and non-motor dyskinesia.

More specifically, a dyskinesia can include one or more the following: paroxysmal dyskinesias, *e.g.*, primary and secondary paroxysmal dyskinesias; paroxysmal kinesigenic dyskinesias (PKD); paroxysmal non-kinesigenic dyskinesias (PNKD); paroxysmal exercise-induced (exertion-induced) dyskinesias (PED); and paroxysmal hypnogenic dyskinesias (PHD).

Trauma-Related Disorders

In specific embodiments, the present invention provides a method of treating a trauma-related disorder, comprising administering to an animal in need of such treatment an effective amount of a compound or pharmaceutical composition of the present invention.

In specific embodiments, trauma-related disorders comprise brain trauma; head trauma (closed and penetrating); head injury; tumors, especially cerebral tumors affecting the thalamic or temporal lobe head injuries; cerebrovascular disorders (diseases affecting the blood vessels in the brain), such as stroke, ischemia, hypoxia, and viral infection (*e.g.*, encephalitis); excitotoxicity; and seizures.

Conditions within the scope of the invention that are amenable to neuroprotection include: Stroke; traumatic brain injury (TB); Dementia; Alzheimer's disease; Parkinson's disease; Huntington's disease; Cerebral palsy; Post-polio syndrome; Guillain-Barre syndrome, and Multiple Sclerosis; and other developmental syndromes, genetic conditions, and progressive CNS diseases affecting cognitive function, such as autism spectrum disorders, fetal alcohol spectrum disorders (FASD), Rubinstein-Taybi syndrome, Down syndrome, and other forms of mental retardation.

Pain Disorders

In specific embodiments, the invention provides methods of treating pain, comprising administering to an animal in need of such treatment an effective amount of a compound or pharmaceutical composition described herein. The utility of PDE4 inhibitors in the treatment of pain is known in the literature.

In particular embodiments, the pain disorder includes one or more of the following: dental pain, cancer pain, myofascial pain, perioperative pain, acute pain, chronic pain, posttraumatic pain, trigeminal neuralgia, migraine severe pain, intractable pain, neuropathic pain, post-traumatic pain, cancer pain, non-cancer pain. Pain also encompasses a pain disorder associated with psychological factors, a pain disorder associated with a general medical condition, and a pain disorder associated with both psychological factors and a general medical condition.

Cognitive Disorders

In particular embodiments of the invention, the neurological disorder is a cognitive disorder. Accordingly, the present invention provides a method of treating a cognitive disorder, comprising administering to an animal in need of such treatment an effective amount of a compound or pharmaceutical composition described herein. The utility of PDE4 inhibitors in the treatment of cognitive disorders is known in the literature (*e.g.*, U.S. Pat. No. US 7,829,713; U.S. Pat. No. US8,338,405).

Cognitive disorders can significantly impair social and occupational functioning, adversely impacting the autonomy and quality of life of the affected individual. An estimated four to five million Americans (about 2% of all ages and 15% of those older than 65) have some form and degree of cognitive impairment (Abrams et al., *Merck Manual of Geriatrics*, 1995, Whitehouse Station (NJ), Medical Services).

Cognitive disorders reflect problems in cognition, *i.e.*, the general processes by which knowledge is acquired, retained and used. Accordingly, cognitive disorders can encompass impairments in such functions as concentration, perception, attention, information processing, learning, memory, or language. Cognitive disorders can also encompass impairments in psychomotor learning abilities, which include physical skills, such as movement and coordination; fine motor skills such as the use of precision instruments or tools; and gross motor skills, such as dance, musical, or athletic performance.

Cognitive disorders also encompass impairments in executive functions, which include abilities underlying the planning and execution of goal-oriented behaviors. Such abilities include flexibility, *i.e.*, the capacity for quickly switching to the appropriate mental mode; anticipation and prediction based on pattern recognition; reasoning and problem-solving; decision making; working memory, *i.e.,* the capacity to hold and manipulate internally- or externally-derived information in real time; emotional self-regulation, including the ability to recognize and manage one's emotions for good performance; sequencing, such as the ability to dissect complex actions into manageable units and prioritize them in the right order; and self-inhibition, *i.e.,* the ability to withstand distraction and internal urges.

Cognitive disorders also comprise cognitive impairments (deficits or dysfunctions) that are associated with (due to) to CNS disorders. In one aspect, a cognitive impairment can be a direct result of a CNS disorder. For example, impairments in speech and language can directly result from a stroke or head-injury that damages the brain regions controlling speech and language, as in aphasia.

In another aspect, a cognitive impairment is associated with a complex CNS disorder, condition, or disease. For example, a cognitive impairment can comprise a deficit in executive control that accompanies autism or mental retardation; a deficit in memory associated with

schizophrenia or Parkinson's disease; or a cognitive deficit arising from multiple sclerosis. In the case of multiple sclerosis (MS), for example, about one-half of MS patients will experience problems with cognitive function, such as slowed thinking, decreased concentration, or impaired memory. Such problems typically occur later in the course of MS – although in some cases they can occur much earlier, if not at the onset of disease.

Cognitive impairments can be due to many, non-exclusive categories of CNS disorders, including the following (and as described herein):

(1) dementias, such as those associated with Alzheimer's disease, Parkinson's disease; Huntington's disease, Pick's disease, Creutzfeldt-Jakob, AIDS Dementia, and other neurodegenerative disorders; and cognitive disabilities associated with progressive diseases involving the nervous system, such as multiple sclerosis.

(2) psychiatric disorders, which include affective (mood) disorders, such as depression and bipolar disorders; psychotic disorders, such as schizophrenia and delusional disorder; and neurotic and anxiety disorders, such as phobias, panic disorders, obsessive-compulsive disorder, generalized anxiety disorder; eating disorders; and posttraumatic stress disorders.

(3) developmental syndromes, genetic conditions, and progressive CNS diseases affecting cognitive function, such as autism spectrum disorders; fetal alcohol spectrum disorders (FASD); Rubinstein-Taybi syndrome; Down syndrome, and other forms of mental retardation; and multiple sclerosis.

(4) trauma-dependent losses of cognitive functions, *i.e.*, impairments in memory, language, or motor skills resulting from brain trauma; head trauma (closed and penetrating); head injury; tumors, especially cerebral tumors affecting the thalamic or temporal lobe; cerebrovascular disorders (diseases affecting the blood vessels in the brain), such as stroke, ischemia, hypoxia, and viral infection (*e.g.*, encephalitis); excitotoxicity; and seizures. Such trauma-dependent losses also encompass cognitive impairments resulting from extrinsic agents such as alcohol use, long-term drug use, and neurotoxins, *e.g.*, lead, mercury, carbon monoxide, and certain insecticides (*e.g.*, Duncan et al., *Drug Discover. Ther.* 2012, *6*, 112-122).

(5) age-associated cognitive deficits, including age-associated memory impairment (AAMI; also referred to herein as age-related memory impairment (AMI)), and deficits affecting patients in early stages of cognitive decline, as in Mild Cognitive Impairment (MCI); and

(6) learning, language, or reading disabilities, such as perceptual handicaps, dyslexia, and attention deficit disorders.

Accordingly, the invention provides a method of treating a cognitive impairment associated with a CNS disorder selected from one or more of the group comprising: dementias,

including those associated with neurodegenerative disorders; psychiatric disorders; developmental syndromes, genetic conditions, and progressive CNS diseases and genetic conditions; trauma-dependent losses of cognitive function, age-associated cognitive deficits; and learning, language, or reading disorders.

Dementias

In a specific embodiment, the invention provides a method of treating a cognitive deficit associated with dementia, comprising administering to an animal in need of such treatment an effective amount of a compound or pharmaceutical composition described herein.

Dementias are neurodegenerative diseases characterized by learning and cognitive deficiencies and are typically accompanied by behavioral symptoms, psychological symptoms and motor symptoms. More particularly, dementia symptoms can include difficulty with many areas of mental function, including emotional behavior or personality, language, memory, perception, and thinking and judgment.

Dementias include, but are not limited to, the following: dementia due to Alzheimer's disease (with early or late onset), dementia due to Parkinson's disease, dementia due to Pick's disease, dementia due to Creutzfeldt-Jakob disease, dementia due to HIV disease, dementia due to head trauma; dementia due to a vascular disease ("vascular dementia"), Lewy body dementia, fronto-temporal dementia, Pick's disease and corticobasal degeneration.

In one embodiment, dementia is due to Alzheimer's disease. Accordingly, the present invention provides a method of treating dementia due to Alzheimer's disease, comprising administering to an animal in need of such treatment a therapeutically effective amount of a compound or pharmaceutical composition described herein. The utility of PDE4 inhibitors in the treatment of Alzheimer's disease is known in the literature. Accordingly, the invention provides a method of treating dementia due to Alzheimer's disease, comprising administering to an animal in need of such treatment a therapeutically effective amount of a compound or pharmaceutical composition described herein.

In another embodiment, dementia is due to Parkinson's disease. Accordingly, the invention provides a method of treating dementia due to Parkinson's disease, comprising administering to an animal in need of such treatment a therapeutically effective amount of a compound or pharmaceutical composition described herein. Dementia has been reported to occur in approximately 20%-60% of individuals with Parkinson's disease and is more likely to be present in older individuals or those with more severe or advanced disease. The dementia associated with Parkinson's disease is characterized by cognitive and motoric slowing; problems with executive functioning, such as planning tasks, organizing projects, or carrying out goals in the proper

sequence; and impairment in memory retrieval. Declining cognitive performance in individuals with Parkinson's disease is frequently exacerbated by depression. The utility of PDE4 inhibitors in treating Parkinson's disease is known in the literature.

Dementia has been reported to occur in approximately 20%-60% of individuals with Parkinson's disease and is more likely to be present in older individuals or those with more severe or advanced disease. The dementia associated with Parkinson's disease is characterized by cognitive and motoric slowing, executive dysfunction, and impairment in memory retrieval. Declining cognitive performance in individuals with Parkinson's disease is frequently exacerbated by depression. For a review, Davie, *Br. Med. Bull.* 2008, *86*, 109–127. The motor symptoms of Parkinson's disease result from the death of dopamine-generating cells in the substantia nigra, a region of the midbrain; the cause of this cell death is unknown. Early in the course of the disease, the most obvious symptoms are movement-related. Four motor symptoms are considered cardinal in PD: shaking (tremors), rigidity, slowness of movement, and postural instability, *i.e.*, difficulty with walking and gait (*e.g.*, Jankovic, *J. Neurol. Neurosurg. Psychiatr.* 2008, *79*, 368-376). Later, cognitive and behavioral problems may arise, with dementia commonly occurring in the advanced stages of the disease. Other symptoms include sensory, sleep and emotional problems. PD is more common in the elderly, with most cases occurring after the age of 50.

In another aspect, a cognitive impairment is associated with a complex CNS syndrome, condition, or disease. For example, a cognitive impairment can comprise a deficit in executive control that accompanies autism or mental retardation; a deficit in memory associated with schizophrenia or Parkinson's disease; or a cognitive deficit arising from multiple sclerosis. In the case of multiple sclerosis (MS), for example, about one-half of MS patients will experience problems with cognitive function, such as slowed thinking, decreased concentration, or impaired memory. Such problems typically occur later in the course of MS – although in some cases they can occur much earlier, if not at the onset of disease.

In one aspect, a cognitive impairment can be a direct result of a CNS disorder. For example, impairments in speech and language can directly result from a stroke or head-injury that damages the brain regions controlling speech and language, as in aphasia.

Psychiatric Disorders

In a specific embodiment, the invention provides a method of treating a cognitive deficit associated with a psychiatric disorder, comprising administering to an animal in need of such treatment an effective amount of a compound or pharmaceutical composition described herein. Psychiatric disorders include affective disorders (mood disorders), such as depression and bipolar disorders; psychotic disorders, such as schizophrenia and delusional disorder; and

neurotic and anxiety disorders, such as phobias, panic disorders, obsessive-compulsive disorder, generalized anxiety disorder, eating disorders, and posttraumatic stress disorders.

Developmental Syndromes, Genetic Disorders, and Progressive Diseases

In a specific embodiment, the invention provides a method of treating a cognitive deficit associated with a developmental syndrome, genetic disorder, or progressive disease, comprising administering to an animal in need of such treatment an effective amount of a compound or pharmaceutical composition described herein. In a specific aspect, the cognitive deficit is associated with an autism spectrum disorder; a fetal alcohol spectrum disorder (FASD); Rubinstein-Taybi syndrome; Down syndrome, and other forms of mental retardation; and multiple sclerosis.

Trauma-Related Disorders

In a specific embodiment, the invention provides a method of treating a cognitive deficit associated with trauma. Such trauma-dependent losses of cognitive function include, but are not limited to, those due to cerebrovascular diseases, including stroke and ischemia; brain trauma, including subdural hematoma and brain tumor; traumatic brain injury (TBI) and head injury.

Such trauma-dependent losses also encompass cognitive impairments resulting from extrinsic agents such as alcohol use, long-term drug use, and neurotoxins such as lead, mercury, carbon monoxide, and certain insecticides.

Stroke

In some embodiments, chemical entities and compositions of the present invention are useful in treating stroke, and in more specific embodiments, treating motor or cognitive impairments during post-stroke rehabilitation. Stroke care is a temporal continuum that includes immediate (acute) treatments and subsequent rehabilitative therapy.

Acute treatments directly target the initial damage, such as that triggered by ischemic or hemorrhagic stroke; they usually involve using agents to dissolve clots and restore blood flow to reduce tissue damage and stabilize the patient. The efficacy of acute treatments is typically limited to a short time window extending only a few hours from stroke onset.

Rehabilitation becomes the therapeutic focus after the patient has been medically stabilized. Rehabilitation (also referred to as "stroke rehabilitation" or "post-stroke rehabilitation") is directed to cognitive and motor deficits that persist after the initial stroke injury, the goal being to restore and recover neurological function as much as possible to compensate for the permanent tissue loss. (*e.g.*, 1995 Clinical Guideline by the Department of Health and Human Services on Post-Stroke Rehabilitation.)

Stroke rehabilitation is typically a comprehensive program coordinated by a team of medical professionals. A physical therapist on the team, for example, may focus on maintaining and restoring range of motion and strength in affected limbs, maximizing mobility in walking, improving manual dexterity, and rehabilitating other motor and sensorimotor functions. A mental health professional may be involved in the treatment of loss of cognitive skills. Rehabilitation services can occur in multiple environments, such as a rehabilitation hospital, long-term care facility, outpatient clinic, or at home.

Neurological functions impacted by stroke (and which can be targeted during rehabilitation) include impairments in cognitive and motor functions. Cognitive function impairments, for example, can manifest as deficits in understanding speech or writing (aphasia); knowing the right words but having trouble saying them clearly (dysarthria); as well as deficits in other cognitive functions, such as attention, reasoning, planning, execution, and learning and memory. Motor function impairments, for example, can manifest as weakness (hemiparesis) or paralysis (hemiplegia) on one side of the body that may affect the whole side or just the arm or leg; by problems with balance or coordination; deficits in gross motor skills such as gait and walking speed; deficits in fine motor skills or manual dexterity; and deficits in upper and lower extremity function.

Accordingly, the present invention provides the use of a PDE4 inhibitor in the treatment of stroke, including methods of post stroke rehabilitation. In certain embodiments, chemical entities of the present invention are useful during stroke rehabilitation to treat stroke deficits (or "post-stroke deficits") resulting from impaired neurological functions. In some embodiments, the present invention provides methods of post-stroke rehabilitation comprising: (a) administering to a subject in need thereof a PDE4 inhibitor during recovery of the subject from stroke; (b) providing training to the subject under conditions sufficient to improve performance of a neurological function whose impairment is due to said stroke; and (c) repeating steps (a) and (b) one or more times, whereby the amount of training sufficient to improve the performance is reduced relative to that produced by training alone.

In one aspect, the PDE4 inhibitor is a chemical entity of the present invention. In some embodiments, the deficit is a motor deficit. In other embodiments, the deficit is a cognitive deficit, particularly, a deficit in memory formation, and more specifically, a deficit in long-term memory formation. In still other embodiments, the deficit may include a cognitive and motor deficit. In another aspect, training comprises a battery of tasks directed to the neurological function. In a specific aspect, the reduction in the amount of training is a reduction in the number of training sessions.

In a further embodiment, one or more training steps are separated by a discrete interval. In one aspect, each training step is provided daily. In other aspects, the interval between one or more training steps can be less than one day or more than one day *e.g.,* such as once a week, twice a week, three times a week, or longer.

In a further embodiment, said administering step (a) is in conjunction with said training step (b). In one aspect, the subject is a human. In another aspect, the subject has undergone neuronal stem cell manipulation. In other aspects, the compound is administered before and during each training session.

Age-Associated Cognitive Deficits

AAMI

In a specific embodiment, the invention provides a method of treating an age-associated cognitive deficit. In one aspect, the age-associated cognitive deficit is age-related memory impairment (AAMI). Accordingly, the invention provides a method of treating age-associated memory impairment (AAMI), comprising administering to an animal in need of such treatment an effective amount of a compound or pharmaceutical composition described herein.

AAMI is a decline in various cognitive abilities, in particular memory abilities, associated with normal aging. For example, AAMI subjects show a decline in the ability to encode new memories of events or facts, as well as working memory (Hedden and Gabrieli, *Nat. Rev. Neurosci.* 2004, *5*, 87–96). In addition, AAMI subjects, when compared with age-matched controls, appeared to be impaired in tests of executive functions associated with frontal lobe function. These and other studies suggest an important role for frontal lobe dysfunction in the memory loss of elderly people. More generally, studies comparing the effects of aging on episodic memory, semantic memory, short-term memory and priming find that episodic memory is especially impaired in normal aging; but some types of short-term memory can also be impaired (Nilsson, *Acta Neurol. Scand. Suppl.* 2003, *179*, 7–13)

In general, an AAMI diagnosis identifies persons with subjectively and objectively evidenced memory loss without cognitive decline impaired enough to warrant the diagnosis of dementia. According to criteria established by the NIH working group (Crook et al., *Devel. Neuropsychol.* 1986, *2*, 261-276) a diagnosis of AAMI includes the following in a person aged 50 or older:

(i) the presence of subjective memory decline, *e.g.,* complaints of memory loss reflected in such everyday problems as difficulty remembering names of

individuals introduced to the subject, misplacing objects, difficulty remembering a list of items to be purchased or a list of tasks to be performed;

(ii) objective evidence of memory loss (*e.g.,* a score at least one standard deviation below the mean of younger adults in a well standardized memory test);

(iii) evidence of adequate intellectual function (*e.g..,* a raw score of at least 32) on the Vocabulary subtest of the Wechsler Adult Intelligence Scale., and

(iv) the absence of dementia (or other memory-affecting disease, such as stroke), *e.g.*, based on the Global Deterioration Scale for assessment of dementia, individuals with AAMI have very mild cognitive decline (level 2) (Reisberg et al., *Am. J. Psych.* 1982, *139*,1136-1139).

Individuals with AAMI have been shown to have a three-fold greater risk for development of dementia than individuals who do not meet AAMI criteria (Goldman and Morris, *Alzheimer Dis. Assoc. Disord.* 2002, *15*:72-79).

MCI

In a specific embodiment, the invention provides a method of treating mild cognitive impairment (MCI), comprising administering to an animal in need of such treatment an effective amount of a compound or pharmaceutical composition described herein.

MCI may be diagnosed when an individual's memory declines below the level considered normal for that age group. In other words, MCI is a condition in which people face memory problems more often than that of the average person their age. These symptoms, however, do not prevent them from carrying out normal activities and are not as severe as the symptoms for Alzheimer's disease. Symptoms often include misplacing items, forgetting events or appointments, and having trouble thinking of desired words.

According to recent research, MCI has been called the transitional state between cognitive changes of normal aging and Alzheimer's disease (AD). Many people who experience mild cognitive impairment are at a high risk of developing Alzheimer’s disease. Indeed, research suggests that: about 12% of people aged 65 or older diagnosed with MCI go on to develop Alzheimer's disease within a year; and that about 40% develop Alzheimer's within three years. This is a much higher rate than in the general population, wherein only about 1% of people aged 65 or older develop Alzheimer's each year.

Thus, people with MCI are considered at heightened risk to develop Alzheimer's disease. These symptoms, however, do not prevent them from carrying out normal activities and are not as severe as the symptoms for Alzheimer's disease. Symptoms often include misplacing items, forgetting events or appointments, and having trouble thinking of desired words (*e.g.*, Arnáiz

and Almkvist, *Acta Neurol. Scand. Suppl.* 2003, *179*, 34–41). Some patients with MCI, however, never progress to AD.

Learning and Related Disabilities

In a specific embodiment, the invention provides a method of treating a learning, language, or reading disability, comprising administering to an animal in need of such treatment an effective amount of a compound or pharmaceutical composition described herein.

Neuroprotection

In specific embodiments, the invention provides a method of neuroprotection, comprising administering to animal in need thereof an effective amount of a chemical entity or composition of the present invention.

Like neuroplasticity, neuroprotection reflects an endogenous neurobiological process that is central to protection of the nervous system. More specifically, neuroprotection refers to the ability to halt or slow the loss of neurons, thereby preventing or slowing disease progression and secondary injuries. In a particular aspect, neuroprotection targets neuronal damage arising from oxidative stress and excitotoxicity – both of which are highly associated with CNS disorders, despite differences in symptoms or injuries.

The utility of PDE4 inhibitors in the treatment of neuronal damage is known in the literature. In addition to neurodegenerative diseases, neuronal damage can also result from other sources of trauma, such as cerebrovascular diseases, including stroke and ischemia; brain trauma, including subdural hematoma and brain tumor; and head injury.

Augmented Cognitive and Motor Training

In certain embodiments, a compound or composition herein is used as an augmenting agent in methods to enhance the efficiency of cognitive or motor training (collectively "training"). Such enhancement methods are collectively known as "augmented training," comprising "augmented cognitive training" or "augmented motor training."

Training generally requires multiple sessions to attain the desired benefits, for example, to rehabilitate a motor deficit or language deficit following stroke. This can be costly and time-consuming, deterring subject compliance and the realization of real world benefits that endure over time. The efficiency of such training protocols can be improved by administering certain agents (known as augmenting agents) in conjunction with the training protocol (*e.g.*, U.S. 7,868,015; U.S. 7,947,731; US 2008-0188525). Augmented training comprises a specific training protocol for a particular brain function, such as that underlying declarative memory, performance of a fine motor skill, locomotion, language acquisition, an executive function, etc., and a general administration of CREB pathway-enhancing drugs. The training protocol

(cognitive or motor training) induces neuronal activity in specific brain regions and produces improved performance of a specific brain (cognitive or motor) function. In other words, the use of augmenting agents achieves cognitive training effects with less repetition, *i.e.*, fewer training sessions.

In some embodiments, the invention provides methods of treating a cognitive disorder, and more particularly, methods for improving a cognitive deficit associated with a central nervous system (CNS) disorder or condition in an animal, comprising treating the animal with an augmenting agent that enhances CREB pathway function in conjunction with cognitive training, wherein the augmenting agent is a compound or composition of the present invention. Exemplary compounds of the present inventions, for example, have been shown to activate CREB in cell-based assays.

In one aspect, the method comprises: (a) providing cognitive training to a subject in need of treatment of a cognitive deficit under conditions sufficient to produce an improvement in performance by said animal of a cognitive function whose impairment is associated with said cognitive deficit; (b) administering a compound or composition of the present invention to the animal in conjunction with said cognitive training; repeating steps (a) and (b) one or more times; and (d) reducing the number of training sessions sufficient to produce the improvement in performance, relative to the same improvement in performance produced by cognitive training alone.

In another aspect, the method comprises: (a) providing cognitive training to a subject in need of treatment of a cognitive deficit under conditions sufficient to produce an improvement in performance by said animal of a cognitive function whose impairment is associated with said cognitive deficit; (b) administering a compound or composition of the present invention to the animal in conjunction with said cognitive training; repeating steps (a) and (b) one or more times; and (d) producing a long-lasting improvement in performance of said function relative to the improvement in performance of said function produced by cognitive training alone.

In one aspect, a compound or composition of the present invention can be used as an augmenting agent in conjunction with any psychotherapeutic approach intended to modulate cognitive function in the brain, thereby enhancing the efficacy of such therapy by reducing the number of sessions necessary to attain benefits.

In another aspect, the cognitive deficit treated by these methods is or includes memory impairment, and more particularly, a defect in long-term memory. Long-term memory (LTM) generally comprises two main biological properties. First, formation of long-term memory requires synthesis of new proteins. Second, it involves cAMP-responsive transcription and is

mediated through the cAMP-response element binding protein (CREB) family transcription factors. Compounds of the present invention can act as CREB-augmenting agents and are therefore useful in enhancing memory formation in an animal, and more particularly, transcription-dependent memory. Indeed, exemplary compounds of the present invention activate CREB in cell-based assays.

In some embodiments, the invention provides methods of treating a motor disorder, and more particularly, methods for improving a motor deficit associated with a central nervous system (CNS) disorder or condition in an animal comprising treating the animal with an augmenting agent that enhances CREB pathway function in conjunction with motor training. Methods are also provided herein for providing sustained improvement in a motor deficit associated with a central nervous system (CNS) disorder or condition in an animal in need of said treatment comprising administering to the animal a compound or composition of the present invention; and detecting said sustained improvement

In one aspect, the method comprises: (a) providing motor training to a subject in need of treatment of a motor deficit under conditions sufficient to produce an improvement in performance by said animal of a motor function whose impairment is associated with said cognitive deficit; (b) administering a compound or composition of the present invention to the animal in conjunction with said motor training; repeating steps (a) and (b) one or more times; and (d) reducing the number of training sessions sufficient to produce the improvement in performance, relative to the same improvement in performance produced by motor training alone.

In another aspect, the method comprises: (a) providing motor training to a subject in need of treatment of a motor deficit under conditions sufficient to produce an improvement in performance by said animal of a motor function whose impairment is associated with said cognitive deficit; (b) administering a compound or composition of the present invention to the animal in conjunction with said motor training; repeating steps (a) and (b) one or more times; and (d) producing a long-lasting improvement in performance of said function relative to the improvement in performance of said function produced by motor training alone.

In other embodiments, the invention provides methods for enhancing a specific aspect of cognitive performance in an otherwise healthy animal (particularly in a human or other mammal or vertebrate) comprising (a) administering to the animal an augmenting agent of the present invention; and (b) training the animal under conditions sufficient to produce an improvement in performance of a particular cognitive task by the animal. In other embodiments, the present invention provides methods of enhancing cognitive or motor performance, as well as methods

for repeated stimulation of neuronal activity or a pattern of neuronal activity, such as that underlying a specific neuronal circuit(s).

Augmenting Agents

Augmenting agents, including the compounds and compositions herein, are able to enhance CREB pathway function. By enhancing CREB pathway function in conjunction with training, such augmented training can decrease the number of training sessions required to improve performance of a cognitive or motor function, relative to the improvement observed by training alone (*e.g.*, U.S. 2007-0203154, U.S. 2011-0160248, U.S. 2010-0317648, and U.S. Pat. No. 8,222,243).

The augmenting agent can be administered before, during or after one or more of the training sessions. In a particular embodiment, the augmenting agent is administered before and during each training session. Treatment with an augmenting agent in connection with each training session is also referred to as the "augmenting treatment".

Training Protocols

Training protocols are generally employed in rehabilitating individuals who have some form and degree of cognitive or motor dysfunction. For example, training protocols are commonly employed in stroke rehabilitation and in age-related memory loss rehabilitation. Because multiple training sessions are often required before an improvement or enhancement of a specific aspect of cognitive (or motor) performance (ability or function) is obtained in the individuals, training protocols are often very costly and time-consuming. Augmented training methods are more efficacious and therefore more cost-effective.

For example, human brain injury often results in motor and cognitive impairments. While advances in critical care medicine and patient management have led to improvements in patient outcome following traumatic brain injury (TBI), there is currently no known treatment to prevent the neuronal cell death and dysfunction that follows TBI. Although multiple treatments have proven neuroprotective in pre-clinical models of TBI, most have failed to show efficacy in humans.

Once a patient is stabilized following TBI, the standard of care dictates extensive motor or cognitive rehabilitation. During this rehabilitation the patient often regains lost skills, finally resulting in improved functional outcome. It would be beneficial if pharmaceutical treatments could be developed to enhance motor or cognitive rehabilitation following TBI, and thus improve functional outcome.

Cognitive and motor training protocols and the underlying principles are well known in the art (*e.g.*, Allen et al., *Parkinsons Dis.* 2012, 1-15; Jaeggi et al., *Proc. Natl. Acad. Sci. USA*

2011, *108*, 10081-10086; Chein et al., *Psychon. Bull. Rev.* 2010, *17*, 193-199; Klingberg, *Trends Cogn. Sci.* 2010, *14*, 317–324; Owen et al., *Nature* 2010, *465*, 775–778; Tsao et al., *J. Skills* 1991, *73*, 219-224; Wek and Husak, *Percept. Mot. Skills,* 1989, *68*, 107-113;

Cognitive training protocols are directed to numerous cognitive dimensions, including memory, concentration and attention, perception, learning, planning, sequencing, and judgment. Motor training protocols can be directed to numerous motor domains, such as the rehabilitation of arm or leg function after a stroke or head injury. One or more protocols (or modules) underling a training program can be provided to a subject.

In some embodiments, the protocols can be used to treat, or rehabilitate, cognitive or motor impairments in afflicted subjects. Such protocols may be restorative or remedial, intended to reestablish prior skills and functions, or they may be focused on delaying or slowing cognitive or motor decline due to neurological disease. Other protocols may be compensatory, providing a means to adapt to a cognitive or motor deficit by enhancing function of related and uninvolved brain domains. In other embodiments, the protocols can be used to improve particular skills or cognitive or motor functions in otherwise healthy individuals. For example, a cognitive training program might include modules focused on delaying or preventing cognitive decline that normally accompanies aging; here the program is designed to maintain or improve cognitive health.

In general, a training protocol (or module) comprises a set of distinct exercises that can be process-specific or skill-based: Process-specific training focuses on improving a particular domain such as attention, memory, language, executive function, or motor function. Here the goal of training is to obtain a general improvement that transfers from the trained activities to

untrained activities associated with the same cognitive or motor function or domain. For example, an auditory cognitive training protocol can be used to treat a student with impaired auditory attention. At the end of training, the student should show a generalized improvement in auditory attention, manifested by an increased ability to attend to and concentrate on verbal information presented in class—and therefore to remember to write down and complete homework assignments. Similarly, a cognitive training protocol may be directed to impaired executive function in an autistic subject, preventing the subject from carrying out instructions to complete an activity, such as making a meal, cleaning one's room, or preparing for school in the morning. Cognitive training allows the subject to focus his attention and concentration and as a result, complete the sequence of tasks required for such activities.

Skill-based training is aimed at improving performance of a particular activity or ability. Here the goal of training is to obtain a general improvement in the skill or ability. For example, a training protocol may focus on learning a new language, performing a musical instrument, improving memory, or learning a fine motor skill. The different exercises within such a protocol will focus on core components underlying the skill. Modules for increasing memory, for example, may include tasks directed to the recognition and use of fact, and the acquisition and comprehension of explicit knowledge rules.

Some rehabilitation programs may rely on a single strategy (such as computer-assisted cognitive training) targeting either an isolated cognitive function or multiple functions concurrently. For example, the CogState testing method comprises a customizable range of computerized cognitive tasks able to measure baseline and change in cognitive domains underlying attention, memory, executive function, as well as language and social-emotional cognition (*e.g.*, Yoshida et al., *PloS ON*, 2011, *6*, e20469; Frederickson *et al.*, *Neuroepidemiology* 2010, 34, 65-75). Other rehabilitation programs may use an integrated or interdisciplinary approach. Cognitive and motor training programs may involve computer games, handheld game devices, interactive exercises, and may employ feedback and adaptive models.

Neurorehabilitation and Neurorecovery

In other embodiments, the invention further relates to the use of compounds and compositions of the present invention in neurorecovery and neurorehabilitation - endogenous neurobiological processes that are central to recovery of cognitive and motor impairments of the nervous system (*e.g.*, Harkema et al., *Arch. Phys. Med. Rehabil.* 2012, *93*, 1588-1597; Muresanu et al., *J. Cell. Mol. Med.* 2012, *16*, 2861-2871).

Neurorehabilitation or neurorecovery generally refers to a collection process that focuses on aiding a person's recovery from a neurological disorder, or helping that individual to live a

more normal, active, and independent life. For example, the quality of life of a person can be greatly affected by a brain or spinal cord injury, or a medical condition which affects the mobility, cognitive functions, or other physical or psychological processes that have been affected by changes in the nervous system. The goal of neurorehabilitation is to combat those changes and improve quality of life by various therapies.

Conditions within the scope of the invention that are treated by neurorehabilitation and neurorecovery include: Stroke; traumatic brain injury (TB); Dementia; Alzheimer's disease; Parkinson's disease; Huntington's disease; Cerebral palsy; Post-polio syndrome; Guillain-Barre syndrome, and Multiple Sclerosis; and other developmental syndromes, genetic conditions, and progressive CNS diseases affecting cognitive function, such as autism spectrum disorders, fetal alcohol spectrum disorders (FASD), Rubinstein-Taybi syndrome, Down syndrome, and other forms of mental retardation.

By focusing on all aspects of a person's well-being, neurorehabilitation or neurorecovery offers a series of therapies from the psychological to occupational, teaching or re-training patients on mobility skills, communication processes, and other aspects of that person's daily routine. Neurorehabilitation or neurorecovery also provides focuses on nutrition, psychological, and creative parts of a person's recovery.

In one embodiment, the present invention provides a method of augmenting neurorehabilitation or neurorecovery from a cognitive impairment, comprising (a) providing cognitive training to a subject in need of treatment of a cognitive deficit under conditions sufficient to produce an improvement in performance by said animal of a cognitive function whose impairment is associated with said cognitive deficit; (b) administering a compound or composition of the present invention to the animal in conjunction with said cognitive training; repeating steps (a) and (b) one or more times; and (d) producing a long-lasting improvement in performance of said function relative to the improvement in performance of said function produced by cognitive training alone.

In another embodiment, the present invention provides a method of augmenting neurorehabilitation or neurorecovery from a motor impairment, comprising: (a) providing motor training to a subject in need of treatment of a motor deficit under conditions sufficient to produce an improvement in performance by said animal of a motor function whose impairment is associated with said cognitive deficit; (b) administering a compound or composition of the present invention to the animal in conjunction with said motor training; repeating steps (a) and (b) one or more times; and (d) reducing the number of training sessions sufficient to produce the improvement in performance, relative to the same improvement in performance produced by motor training alone.

Non-Human Animal Training Protocols

Aside from applications for humans, compounds and compositions of the present invention have additional uses for non-human animals, namely in enhancing (augmenting) the efficiency of training protocols directed to numerous cognitive and motor functions.

Conditions, under which non-human animals would benefit, include enhanced (augmented) training procedures for specific purposes, (*e.g.* hunting dogs, guide dogs, police dogs etc, or animals used in movie industry).

Enhanced training protocols can also benefit animals that have been exposed to stressful or traumatic conditions and are in need of training to treat the resulting cognitive impairments. Such a need may arise, for example, after such an animal has been captured or transported, subjected to new housing conditions (as in a change of domicile or owner), or has developed analogous disorders and is distressed or aggressive, or displays stereotypic behavior, obsessive-compulsive behavior, or anxiety. Animals which are subject to stress would also include animals used in racing (eg. dogs, horses, camels) or other sports, performing animals (such as circus animals and those appearing on stage, television or in the movies) and horses that perform dressage and other highly disciplined routines.

Compounds of the present invention can also enhance the efficiency of rehabilative protocols following physical injury to a non-human animal, such as limb amputation. For example, administering an augmenting agent of the present invention in conjunction with a trainin protocol can increase the efficiency of a rehabilitative program by decreasing the number of training sessions necessary to achieve an improvement in motor function.

In particular embodiments, compounds and compositions of the present invention are used in methods of training service animals. By combining augmenting agents of the present invention with training protocols, the efficiency of training non-human animals for service in both the public and private sectors will be enhanced. Service animals are typically dogs. However, other non-human animals can also be trained to perform services, such as assisting blind or disabled people. For example, miniature horses can be trained to guide the blind, to pull wheelchairs, or to provide support for Parkinson's patients. As another example, capuchin monkeys can be trained to assist disabled perform manual tasks, such as grasping items, operating knobs and switches, turning the pages of a book.

In specific embodiments, augmented training with compounds and compositions of the present invention can be used to reduce the number of training sessions necessary to teach an animal skills that are useful in public service, such as in law enforcement. In dogs, for example, such skills include, but are not limited to, the following: (i) public order maintenance, *e.g.*, chasing, holding, or detaining suspects; (ii) search and rescue, *e.g.*, locating suspects, missing

persons, or objects; and (iii) contraband detection, *e.g.,* detecting illicit substances such as drugs, narcotics, explosives, weapons, and even human remains. Such methods can therefore be applied to police dogs, bomb-sniffing dogs, drug-sniffing dogs, search and rescue dogs, etc.

In other embodiments, augmented training (with compounds and compositions of the present invention) can be used to reduce the number of training sessions required to teach animals skills that are useful in the private sector, such as security and medical care. In dogs, for example, such skills can include, but are not limited to, the following: (i) private security, *e.g.*, guarding property or protecting an individual; (ii) handicap assistance, *e.g.*, providing eyes for the visually impaired, ears for the hearing-impaired, arms and legs for the physically-disabled; (iii) health care, *e.g.,* detecting cancer or altering a caregiver to seizures in a subject; (iv) psychiatric assistance, *e.g.*, calming a phobic person under stress-triggering conditions, or alerting an autistic person to distracting repetitive movements such as hand flapping; and (v) pest control, *e.g.*, identifying source of infestations by bedbugs or termites.

In some embodiments, the training protocol can be directed to a single skill or task, such as the detection of a single drug. In other embodiments, the training protocol can be directed to a complex set of skills, such as those underlying search and rescue. For a complex set of skills, training will therefore comprise more than one task.

In another aspect, when training is carried out with a wide enough scope of tasks, a generalized "rehabilitation" effect is expected, resulting in generalized improved function of one or more cognitive domains. This results in improved performance of the animal of related tasks (involving the same cognitive domains) that are not specifically part of the training protocol.

Accordingly, the present invention provides a method of reducing the time necessary to teach an animal one or more skills, wherein said reducing comprising: a) administering an augmenting agent of the present invention to the animal; b) providing a training protocol to said dog under conditions to improve performance of one or more tasks, wherein said training protocol comprises multiple training sessions; and c) decreasing the number of training sessions required to improve performance of said one or more tasks relative to the number of said training sessions required to produce said improvement in performance by the training protocol alone.

The training protocol can be provided to the animal under conditions to improve performance of a single task; a complex set of tasks; or a wide scope of tasks, resulting in generalized improved function of one or more cognitive domains. The tasks can relate to a skill involved in public service, such as public order maintenance, search and rescue, and contraband detection. The tasks can also relate to a skill involved in private service, such as private security, handicap assistance, health care, psychiatric assistance, and pest control.

Peripheral Disorders

PDE4 enzymes are located in a number of peripheral tissues. For example, one or several PDE4D isoforms are expressed throughout most tissues tested, including cortex, hippocampus, cerebellum, heart, liver, kidney, lung and testis (Richter et al., *Biochem. J.,* 2005, 388, 803-811). The localization and regulation of PDE4D isoforms is thought to allow for tight and local regulation of cAMP levels, possibly limiting signal propagation in specific subcellular compartments.

Thus, in one embodiment, the invention provides a method of treating a peripheral disorder associated with PDE4, by administering to an animal in need thereof a therapeutically effective amount of a compound or pharmaceutical composition described herein.

The peripheral disorder may include, but is not limited to, such PDE4-associated disorders as inflammatory bowel disease (Banner and Trevethick, 2004, *Trends Pharmacol. Sci.* 25, 430–436); rheumatoid arthritis (Kobayashi et al., 2007, *Mediators Inflamm.* 2007, 58901); chronic obstructive pulmonary disease (COPD), asthma, allergic rhinitis, pulmonary artery hypertension (DeFranceschi et al., 2008, *FASEB J.*, 22, 1849-1860); renal diseases (Conti et al., 2003, *J. Biol. Chem.*, 278, 5493); allergic skin diseases and psoriasis (Baumer et al., 2007, *Inflamm. Allergy Drug Targets*, 6, 17–26).

The present disclosure will be further illustrated by the following non-limiting Examples. These Examples are understood to be exemplary only, and they are not to be construed as limiting the scope of the invention herein, and as defined by the appended claims.

EXAMPLES

Chemistry:

In obtaining the compounds described in the examples below, and the corresponding analytical data, the following experimental and analytical protocols were followed unless otherwise indicated.

Unless otherwise stated, reaction mixtures were magnetically stirred at room temperature (rt) under nitrogen atmosphere. Where solutions were "dried", they were generally dried over a drying agent such as Na_2SO_4 or $MgSO_4$. Where mixtures, solutions, and extracts were "concentrated", they were typically concentrated on a rotary evaporator under reduced pressure.

Reactions under microwave irradiation conditions were carried out in a CEM Discover-SP with Activent microwave reaction apparatus, model number 909150, or Biotage Initiator, model number 355302.

Normal-phase flash column chromatography (FCC) was performed on silica gel (SiO_2) using packed or prepackaged cartridges, eluting with the indicated solvents.

LC/MS were obtained on a Waters 2695 Separations Unit, 2487 Dual Absorbance Detector, Micromass ZQ fitted with ESI Probe, or a Waters Acquity™ Ultra performance LC (UPLC) with PDA eλ and SQ detectors.

Nuclear magnetic resonance (NMR) spectra were obtained in a Varian 400 MHz or Bruker 400 MHz NMR. Samples were analyzed in either deuterated chloroform ($CDCl_3$), methanol-d_4 (CD_3OD), or dimethyl sulfoxide-d_6 (DMSO-d_6). For $CDCl_3$ samples, tetramethylsilane (TMS) was used as an internal standard with the TMS resonance set to a chemical shift of 0.00 ppm for ^1H NMR spectra. For CD_3OD the residual central resonance peak at 3.31 for ^1H was used for chemical shift assignment and for DMSO-d_6 the residual central resonance peak at 2.50 ppm for ^1H was used for chemical shift assignment. The format of the ^1H NMR data below is: chemical shift in ppm downfield the tetramethylsilane reference (multiplicity, coupling constant J in Hz, integration).

Chemical names were generated using ChemDraw Ultra 12.0 (CambridgeSoft Corp., Cambridge, MA) or ChemAxon.

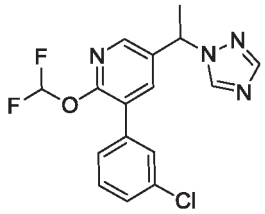
Example 149. 3-(3-Chlorophenyl)-2-(difluoromethoxy)-5-[1-(1H-1,2,4-triazol-1-yl)ethyl]pyridine.



Step 1. 1-(5-(3-chlorophenyl)-6-(difluoromethoxy)pyridin-3-yl)ethanol. A solution of 5-(3-chlorophenyl)-6-(difluoromethoxy)nicotinaldehyde (Example 36 product from Step 2., 287 mg, 1.0 mmol) in DCM (5 mL) was cooled to 0 °C and methylmagnesium bromide (1.5 mL of a 1M solution in toluene, 1.5 mmol) was added dropwise. The mixture was warmed to room temperature and stirred for 30 minutes. A saturated aqueous solution of ammonium chloride was added and the mixture was extracted into DCM. The combined extracts were dried (Na_2SO_4), filtered and solvent removed under reduced pressure. Purification (FCC, SiO_2, 0 - 60%, EtOAc/hexanes) gave 1-(5-(3-chlorophenyl)-6-(difluoromethoxy)pyridin-3-yl)ethanol (231 mg, 70%). [M+H] = 300.1.

Step 2. A solution of 1-(5-(3-chlorophenyl)-6-(difluoromethoxy)pyridin-3-yl)ethanol (231 mg, 0.76 mmol) and DIPEA (196 mg, 1.52 mmol) in THF (5 mL) was cooled to 0 °C and methansulfonyl chloride (108 mg, 0.92 mmol) was added. The mixture was warmed to room temperature and stirred for 1 hour. The LCMS confirmed the disappearance of the starting material. All solvents were removed in vacuo and the crude material purified (FCC, SiO_2, 0 - 60%, EtOAc/hexanes) to give the desired intermediate mesylate (205 mg, 70%) which was not characterized, and used directly in the next step.

Step 3. 3-(3-Chlorophenyl)-2-(difluoromethoxy)-5-[1-(1H-1,2,4-triazol-1-yl)ethyl]pyridine. The mesylate from the previous step (90 mg, 0.23 mmol) was reacted in a manner analogous to Example 127, with the appropriated starting material substitutions. Purification (FCC, SiO_2, 50 - 100%, EtOAc/hexanes) gave the title compound (56 mg, 69%). ^{1}H NMR (400 MHz, CD_3OD) δ 8.64 (s, 1H), 8.24 (d, *J* = 2.3 Hz, 1H), 8.02 (s, 1H), 7.91 (d, *J* = 2.3 Hz, 1H), 7.82 - 7.59 (m,

PHARMACOLOGICAL EXAMPLES

The present disclosure will be further illustrated by the following pharmacological examples. These examples are understood to be exemplary only and are not intended to limit the scope of the invention disclosed herein.

Enzymatic Assay

An IMAP TR-FRET based PDE assay was developed using the PDE4D3 isoform. IMAP technology is based on high-affinity binding of phosphate by immobilized metal (MIII) coordination complexes on nanoparticles. The IMAP "binding reagent" recognizes phosphate groups on AMP or GMP generated from cAMP or cGMP in a PDE reaction. The cyclic nucleotides that carry a phosphodiester bond and not a free phosphate are not recognized by the binding reagent. The time resolved fluorescence resonance energy transfer (TR-FRET) is afforded by a Terbium (Tb)-Donor prebound to the nanoparticles. FRET can occur when

fluorescent-labeled AMP or GMP product of a PDE reaction binds comes into close proximity of the Tb-Donor complex. Due to the long lifetime of Tb fluorescence, detection can be run in time-resolved mode to eliminate interference from autofluorescent compounds.

The IMAP TR-FRET PDE4D3 FAM-cAMP assay was performed in 1536-well white plates 15 pg per well GST-tagged PDE4D3 was dispensed in 2.5 μL IMAP assay buffer consisting of 10 mM Tris pH 7.2, 10 mM $MgCl_2$, 1mM DTT, 0.1 % fatty acid free BSA and 0.01% Tween-20. 30 nL of compound was then added from 1 mM stock in DMSO using the Kalypsys 1536 10 nL pintool. Plates were incubated for 5 min at RT before dispensing 1.5 μL of 533 nM FAM-cAMP for a final concentration of 200 nM. Plates were incubated 30 min at RT after a brief centrifugation. The assay was terminated by adding 5 μL IMAP binding reagent Tb complex to each well, prepared according to manufacturer's recommendations. Plates were incubated an additional 90 minutes at RT and read on a Viewlux plate reader. Compounds were solvated at 10 mM in DMSO and tested in 11-point dose-response in the PDE4D3 assay.

BIOLOGICAL EXAMPLES

The present disclosure will be further illustrated by the following biological examples. These examples are understood to be exemplary only and are not intended to limit the scope of the invention disclosed herein.

Behavioral Assays

Numerous behavioral assays are available to assess the ability of a candidate compound to enhance memory formation, including contextual conditioning (*e.g.*, fear conditioning), temporal conditioning (*e.g.*, trace conditioning), and object recognition. Other non-limiting examples of appropriate assays to assess memory include those that incorporate or relate to multiple training sessions, spaced training sessions, contextual fear training with single or multiple trials, trace fear conditioning with single or multiple trials, contextual memory generally, temporal memory, spatial memory, episodic memory, passive avoidance memory, active avoidance memory, food preference memory, conditioned taste avoidance, and social recognition memory.

The behavioral assays can also be used in accordance with the present invention, as will be understood by those of ordinary skill in the art. These assays can be directed towards the evaluation of, without limitation, hippocampus-, cortex, and/or amygdala-dependent memory formation or cognitive performance.

Biological Example 1

Effect of PDE4 Inhibitors on Contextual Memory

Rationale

Contextual fear conditioning is a form of associative learning in which animals learn to recognize a training environment (conditioned stimulus, CS) that has been previously paired with an aversive stimulus such as foot shock (unconditioned stimulus, US). When exposed to the same context at a later time, conditioned animals show a variety of conditional fear responses, including freezing behavior. The percent of time during the test that the animal exhibits such freezing provides a quantitative measure of the contextual associative memory (*e.g.*, Fanselow, *Behav. Neurosci.* 1984, *98*, 269-277; Fanselow, *Behav. Neurosci.* 1984, *98*, 79-95; and Phillips and LeDoux, *Behav. Neurosci.* 1992, *106*, 274-285).

Contextual conditioning has been extensively used to investigate the neural substrates mediating fear-motivated learning (*e.g.*, Phillips and LeDoux, *Behav. Neurosci.* 1992, *106*, 274-285; Kim et al., *Behav. Neurosci.* 1993, *107*, 1093-1098; and Bourtchouladze et al., *Learn. Mem.* 1998, *5*, 365-374). Studies in mice and rats provided evidence for functional interaction between hippocampal and nonhippocampal systems during contextual conditioning training (*e.g.*, Maren et al., *Behav. Brain Res.* 1997, *88*, 261-274; Maren et al., *Neurobiol. Learn. Mem.* 1997, *67*, 142-149; and Frankland et al., *Behav. Neurosci.* 1998, *112*, 863-874). Specifically, post-training lesions of the hippocampus (but not pre-training lesions) greatly reduced contextual fear, implying that: 1) the hippocampus is essential for contextual memory but not for contextual learning per se and 2) in the absence of the hippocampus during training, non-hippocampal systems can support contextual conditioning.

Contextual conditioning has been extensively used to study the impact of various mutations on hippocampus-dependent learning, as well as strain and genetic background differences in mice (*e.g.*, Bourtchouladze et al., *Cell* 1994, *79*, 59-68; Bourtchouladze et al., *Learn Mem.* 1998, *5*, 365-374; Kogan et al., *Current Biology* 1997, *7*, 1-11; Silva et al., *Current Biology* 1996, *6*, 1509-1518; Abel et al., *Cell* 1997, *88*, 615-626; Giese et al., *Science* 1998, *279*, 870-873; Logue et al., *Neuroscience* 1997, *80*, 1075-1086; Chen et al., *Behav. Neurosci.* 1996, *110*, 1177-1180; and Nguyen et al., *Learn Mem.* 2000, *7*, 170-179).

Because robust learning can be triggered with a few minutes training session, contextual conditioning has been especially useful to study the biology of temporally distinct processes of short- and long-term memory (*e.g.*, Kim et al., *Behav. Neurosci.* 1993, *107*, 1093-1098; Bourtchouladze et al., *Cell* 1994, *79*, 59-68; Abel et al., *Cell* 1997, *88*, 615-626; Logue et al., *Behav. Neurosci.* 1997, *111*, 104-113; Bourtchouladze et al., *Learn. Mem.* 1998, *5*, 365-374; and Nguyen et al., *Learn. Mem.* 2000, *7*, 170-179). As such, contextual conditioning provides an excellent model to evaluate the effects of novel drug compounds on hippocampal-dependent memory formation.

Procedures

Previous investigations have established that training with 1× or 2× CS-US pairings induces sub-maximal (weak) memory in wild-type mice (*e.g.*, U.S.2009/0053140; Tully et al., *Nat. Rev. Drug Discov*. 2003, *2*, 267-77; and Bourtchouladze et al. *Learn. Mem.* 1998, *5*, 365-374). Accordingly, contextual conditioning in this study was performed as described by Bourtchouladze et al., *Cell* 1994, *79*, 59-68.

Young-adult (10-12 weeks old) C57BL/6 male mice and Sprague Dawley male rats were used. Mice and rats were group-housed in standard laboratory and maintained on a 12:12 light-dark cycle. The experiments were always conducted during the light phase of the cycle. With the exception of testing times, the mice had ad libidum access to food and water. To assess contextual memory, a modified contextual fear conditioning task originally developed for evaluation of memory in CREB knock-out mice was used (Bourtchouladze et al., 1994). Training sessions are comprised of a baseline period in the conditioning chamber (Med Associates, Inc.) followed by presentation of unconditioned stimuli (1-5 footshocks each at 0.2-1.0 mA for 2-sec) spaced at 60-sec intervals. Thirty seconds following the last shock, the animal is returned to the home cage. One to 7 days later, the animals are returned to the chamber and freezing behavior is scored. Freezing (complete immobility except respiration) is scored by Video Freeze software (Med Associates, Inc.) over an 8 minute test period. Treatment with cognition enhancers are expected to significantly increase freezing when compared with controls.

All experiments were designed and performed in a counterbalanced fashion. In each experiment, the experimenter was unaware (blind) to the treatment of the subjects during training and testing. Training and test sessions were recorded as digital video files. Data were analyzed by one-way ANOVA with appropriate post-hoc tests using GraphPad Prism software package.

Results

Exemplary compounds were found to enhance contextual memory in the fear conditioning assay. Significant enhancing effects are seen at several concentrations, including 0.01 mg/kg, 0.03 mg/kg, and 1.0 mg/kg.

Biological Example 2

Effect of PDE4 Inhibitors on Novel Object Recognition

Rationale

Novel Object Recognition (NOR) is an assay of recognition learning and memory retrieval, and it takes advantage of the spontaneous preference of rodents to investigate a novel

object compared with a familiar one. It is an ethologically relevant task, which in contrast to fear conditioning, does not result from negative reinforcement (foot shock)(*e.g.*, Ennaceur and Delacour, *Behav. Brain Res.* 1988, *31*, 47-59).

The NOR test has been employed extensively to assess the potential cognitive-enhancing properties of novel compounds derived from high-throughput screening. Object recognition the task relies on the natural curiosity of rodents to explore novel objects in their environments more than familiar ones. Obviously, for an object to be "familiar," the animal must have attended to it before and remembered that experience. Hence, animals with better memory will attend and explore a new object more than an object familiar to them. During testing, the animal is presented with the training object and a second, novel one. Memory of the training object renders it familiar to the animal, and it then spends more time exploring the new novel object rather than the familiar one (Bourtchouladze et. al., *Proc. Natl. Acad. Sci. USA* 2003, *100*, 10518-10522).

Neuroimaging, pharmacological, and lesion studies have demonstrated that the hippocampus and adjacent perirhinal cortex are critical for object recognition memory in rodents, monkeys, and humans (*e.g.*, Mitchell, *Behav. Brain Res.* 1998, *97*, 107-113; Teng et al., *J. Neurosci.* 2000, *20*, 3853-3863; Mumby, *Brain Res.* 2001, *127*, 159-181; Eichenbaum et al., *Annu. Rev. Neurosci.* 2007, *30*, 127-152; Squire et al., *Nat. Rev. Neurosci.* 2007, *8*, 872-883; and Vann and Alabasser, *Curr. Opin. Neurobiol.* 2011, *21*, 440-445). Hence, object recognition provides an excellent behavioral model to evaluate drug-compound effects on cognitive tasks associated with function of the hippocampus and cortex.

Procedures

Object recognition was tested in young adult mice and rats using the following protocol. Animals are briefly handled by the experimenter 2-5 days prior to training. Each compound was administered between 15 minutes and 24-hours prior to, or following, training. Habituation sessions (duration 1-20 min, over 1-3 days) were conducted to familiarize the animal to the arena. During training trials (duration of 1-20 min) the animals were allowed to explore two identical objects. A test trial (duration of 1-20 min) was then performed 1-96 hrs later.

For novel object recognition, one object is replaced with one that is novel. All combinations and locations of objects are used in a balanced manner to reduce potential biases attributable to preference for particular locations or objects. Training and test trials are recorded and scored by video-tracking software (*e.g.* Noldus Ethovision). An animal is scored as exploring an object when its head was oriented toward the object within a distance of 1 cm (rat)/2 cm (mouse) or when the nose is touching the object. Turning around, climbing, or sitting on an object was not considered as exploration. If the animal generates a long-term memory for

the familiar object, it will spend significantly more time exploring the novel object compared to the familiar object during the retention test (Cognitive enhancers are therefore expected to facilitate this discrimination between the familiar and novel object).

A discrimination index was calculated as previously described (Bourtchouladze et al., *Proc. Natl. Acad. Sci. USA* 2003, *100,* 10518-10522). In each experiment, the experimenter was unaware (blind) to the treatment of the subjects during training and testing. Data were analyzed by one-way ANOVA with appropriate post-hoc tests using GraphPad Prism software package.
