

Kit for the preparation of a vaccinating agent

Abstract:

5 A kit, a use thereof and a process for preparing a vaccine for immunisation against the
disease Porcine Circovirus Disease and/or Enzootic Pneumonia in pigs are proposed, in which a
first container is only partly filled with a first vaccine and a second container is filled with a
second vaccine, the second vaccine being transferred into the first container through an
adapter device, when a closure device is penetrated for the first and/or only time, and the
10 vaccinating agent is prepared therein, thus making the operation simple, less error-prone and
more hygienic, while reducing the materials required.
