METHOD FOR PROMOTING EFFICIENCY OF PURIFICATION OF FC REGION-CONTAINING POLYPEPTIDE

ABSTRACT

It was discovered that, by preparing an Fc region of an Fc region-containing polypeptide in which the first polypeptide chain of the Fc region binds to a Protein A resin, but the second polypeptide chain of the Fc region does not bind to the resin or shows weak binding to it, the amount of the Fc region-containing polypeptide bound per volume of the resin is increased, and more efficient purification of the above-mentioned Fc region-containing polypeptide is possible.
