# MEDICAL/CARE SUPPORT METHOD, MEDICAL/CARE SUPPORT SYSTEM, AND MEDICAL/CARE SUPPORT PROGRAM

## ABSTRACT

A medical/care support method is provided, which enables medical or care workers having different special fields such as physicians and nurses to share the medical or care information of each patient or care-needing person while protecting the privacy of the patient or care-needing person, and to support the provision of better-quality medical or care service to the patient or care-needing person based on the medical or care information shared.

A patient ID, a disease ID, and a medical facility ID are associated and stored, thereby generating a group G11. A patient P1 designated by patient group registration participates in the group G11 after the patient's approval of an invitation request. Medical workers M1 and M2 and patient-related persons R1, R2, and R4 participate in the group G11 as supporters in response to respective invitation requests. The medical information of the patient P1 is shared among the patient P1, the medical workers M1 and M2, and the patient-related persons R1, R2, and R4 who belong to the group G11 according to the sharing rule which the patient P has agreed.
