

TOOTHBRUSH

ABSTRACT

A toothbrush includes a handle and a head connected to an end of the handle. The head has a surface. A plurality of bristles are mounted on the head so the bristles extend from the surface on only one side of the head. The plurality of bristles are arranged in a plurality of sets including first, second, and third sets. The bristles of each of the first, second, and third sets are substantially parallel to other bristles in the same respective set. The bristles in the first and third sets are oriented to angle outwardly from the bristles in the second set as they extend away from the surface.
