Group Information Acquisition Method, Apparatus and Interaction System

Abstract

A method, an apparatus, and an interaction system for obtaining group information are provided in the present application. The method may include detecting a triggering operation for a group information platform in an interface of a client end of a mobile group work platform; sending a page acquisition request for the group information platform to a server end of the mobile group work platform; and displaying a function page of the group information platform based on page data returned by the server, wherein the function page is used for performing a centralized display of group information for registered groups on the mobile group work platform. Using the technical solutions of the present application, processing of internal events of a group can be implemented on a mobile group work platform, while accesses and processing of events external to the group can also be implemented based on connections and communications between the mobile group work platform and a group information platform, thereby realizing quicker information interactions between inside and outside of the same group, and between different groups.
