

Abstract

The VOSIS veterinary orthopedic kit relates to veterinary science and more specifically to orthopedics and traumatology, and can be used in veterinary clinics in the treatment and restoration of function to damaged limbs of dogs, cats and other animals. The technical problem to be solved consists in the timely and quality provision of emergency care to injured animals, an increase in the effectiveness of treatment and the prevention of serious complications. This problem is solved in that orthopedic external fixation systems are provided in a universal and multifunctional set. The VOSIS veterinary orthopedic kit consists of a rectangular container (1) in the form of a box (2) having a lid (3) and being divided by partitions into a plurality of sections. The sections accommodate a set of components and instruments for the purposes of external fixation: polyfunctional monoblocks (4), plates (5), rods and pins (6), bars (7), fasteners (8) and instruments (9). All of the components of the set are marked for ease of identification.
