

Improvements in or relating to organic compounds

The present invention relates to fragrance precursors derived from a reaction between an amine and 3-(4-isobutyl-2-methylphenyl)propanal. These fragrance
5 precursors are able to release 3-(4-isobutyl-2-methylphenyl)propanal. Furthermore, the invention relates to the use of such precursors in perfume preparations. In particular, the invention relates to fragrance precursors or perfume preparations containing said precursors that release fragrance with muguet (lily of the valley) odour characteristics. Still more particularly, the invention relates to said perfume
10 preparations that contain no, or substantially no, LilialTM. The invention further relates to methods of making said perfume precursors and perfume preparations, as well as the use of said perfume precursors and perfume preparations in fine fragrances and consumer products, such as personal care and household care products. The invention also relates to said fine fragrances and consumer products
15 containing said perfume precursors and perfume preparations.

Compounds having muguet odour characteristics are very sought after as perfume ingredients. These compounds are important ingredients in floral bases and can act as harmonizers across many types of fragrance creations. Compounds of this type are used widely in personal care and consumer care products, as well as in fine
20 perfumery, to generate pleasant odours or to mask unpleasant odours.

An excellent perfume ingredient widely valued for its muguet odour note is LilialTM or 3-(4-tert-butylphenyl)-2-methylpropanal (CAS 80-54-6). This compound has found wide use in fine perfumery as well as in personal and household care products. However, its use is controversial in view of recent findings that it exhibits
25 toxic effects on the reproductive organs of male rats and dogs. No effects were found in studies with mice, guinea-pigs and primates, nevertheless, under the Global Harmonized System (GHS) classification system this compound is classified

as a CMR2 material. For CMR category 2 materials, it is necessary to establish that quantities proposed for use are harmless to consumers. In view of the regulatory status of LilialTM it is being replaced with other perfume ingredients.

Recently, applicant has found a novel compound 3-(4-isobutyl-2-
5 methylphenyl)propanal that can be employed as a perfume ingredient in perfume compositions and fine fragrances and consumer products. The novel compound possesses desirable muguet odour characteristics and may be perceived and recognised by perfumers as being very reminiscent of the odour of LilialTM and so can serve as a simple replacement for LilialTM. The novel compound does not
10 attract the regulatory concerns associated with LilialTM. Details of this invention are disclosed in patent application PCT/EP2014/059427, which is hereby incorporated by reference.

Perfumed products such as cleaning or laundry products comprising LilialTM are well-known in the art.

15 However, it is known that fragrances can be altered through degradation caused by interaction with air when incorporated in certain consumer product bases, where alkalinity, acidity, the presence of oxidizing agents, such as hypochlorite salts, or other base components may lead to chemical degradation of the fragrance. In addition, volatile fragrances tend to be dissipated with time.
20 Furthermore, when used in cleaning or laundry products, the deposition of the fragrance on a treated substrate is diminished by the washing and/or rinsing procedure.

Nevertheless, it is desired by consumers to have products that can be stored over time and still giving a constant perfume impression. In particular, the impact of
25 volatile components is to be retained. Furthermore, it is desired that such products create a long-lasting pleasing fragrance slowly emitting from the treated substrate over time.

Therefore, it is an objective of the present invention to provide a system which is capable of releasing the above mentioned LillalTM type fragrance constantly over time and providing a long-lasting release of said fragrance.

It is another objective of the present invention to increase the substantivity of 3-(4-isobutyl-2-methylphenyl)propanal, in particular in consumer product applications, especially in the so-called rinse off applications, like fabric softener or conditioner, as well as in hair shampoo or fabric detergents.

Applicant has found that reaction products of a primary and/or secondary amine compound and 3-(4-isobutyl-2-methylphenyl)propanal can serve as fragrance precursors of 3-(4-isobutyl-2-methylphenyl)propanal. These fragrance precursors provide a delayed release of 3-(4-isobutyl-2-methylphenyl)propanal over a longer period of time than by the use of the fragrance itself.

A reaction of a primary and/or secondary amine compound and 3-(4-isobutyl-2-methylphenyl)propanal may give several reaction products, for examples imines, Schiff bases, hemi-aminals, aminals and enamines. Furthermore, several polymeric and oligomeric products may be formed.

When studying the reaction products of methyl ortho-aminobenzoate (methyl anthranilate) and 3-(4-isobutyl-2-methylphenyl)propanal in a molar ratio in a range from 4:1 to 1:2, applicant surprisingly found that the main reaction product is not an imine or a Schiff base, characterized by a carbon-nitrogen double bond. In contrast, these reaction mixtures comprise at least the corresponding aminal and/or enamine.

Accordingly, the invention provides in a first aspect a fragrance precursor comprising at least the corresponding aminal and/or enamine of the compound of formula I. Such a fragrance precursor can be obtained by a reaction of a primary

and/or secondary amine compound and 3-(4-isobutyl-2-methylphenyl)propanal (compound of formula I)

However, under modified reaction conditions, for example in reactions with an
 5 amino compound and the aldehyde in amended molar ratios and/or depending on
 the nature of the amino compound, further products in different ratios may be
 formed, for example the corresponding imine or Schiff base or the hemi-aminal.

The aminal is a bis-adduct of the amino compound to the compound of formula I.
 The enamine is a mono-adduct of the amino compound to the compound of
 10 formula I, characterized by a carbon-carbon double bond. The enamine is obtained
 as a mixture of E- and Z-isomers, as indicated by the wiggled bond.

Primary amines with the general formula R-NH₂ and secondary amines with the
 general formula R-NHR' are able to react in the described manner. R and R'
 represent substituents such as linear or branched, saturated or unsaturated alkyl
 15 groups or further substituted or unsubstituted aryl groups. In case of a secondary
 amine, the substituents R and R' may form a ring system.

The said fragrance precursors are able to release 3-(4-isobutyl-2-methylphenyl)propanal, a compound with substantially similar odour characteristics
 and performance characteristics as Lilial[™]. The precursors provide an improved
 20 fragrance intensity and a long-lasting release (also known as substantivity) of 3-(4-isobutyl-2-methylphenyl)propanal.

According to the present invention, a fragrance precursor is a substance that is not
 itself a final fragrance, but which, in particular circumstances will break down to

give at least one desired fragrant substance. The fragrance precursor will release the desired fragrance for example by hydrolysis with air moisture or water. The release can also be caused by exposure to light or oxygen, pH change and enzymatic activity.

- 5 The fragrance precursor itself can be odourless. Alternatively, the precursor may be an odorant on its own.

Usually, the fragrance precursor can be obtained by a reaction of 3-(4-isobutyl-2-methylphenyl)propanal and one primary and/or secondary amine compound. In a particular embodiment, a fragrance precursor can be obtained by a reaction of 3-
10 (4-isobutyl-2-methylphenyl)propanal and a mixture of at least two primary and/or secondary amine compounds.

It is preferred to use a fragrance precursor as a prepared compound in a perfume mixture. However, in another aspect of the invention, it is possible to form said fragrance precursor directly in the perfume mixture by adding a primary and/or
15 secondary amine compound and 3-(4-isobutyl-2-methylphenyl)propanal in a molar ratio in a range from 4:1 to 1:100 into the perfume mixture.

Preferably, the primary and/or secondary amine compound is selected from the group consisting of

aromatic amines: methyl 2-aminobenzoate (methyl anthranilate), ethyl 2-
20 aminobenzoate, 2-amino-acetophenone, ethyl 4-aminobenzoate, ortho, meta or para aminobenzoates of formula II (wherein R^1 = C1-C12 linear or branched alkyl, alkenyl, cycloalkyl, cycloalkenyl or alkylaryl and R^2 = H, Me, Et), 1-phenylethylamine, 2-phenylethylamine, 4,4'-methylenedianiline, benzylamine;

primary or secondary aliphatic amines: C8-C30 linear or branched alkylamines or
25 alkyldiamines (e.g. octylamine, dodecylamine, tridecylamine (CAS: 86089-17-0), octadecylamine, nonan-2-amine, undecan-2-amine, 4-ethylcyclohexylamine, 9-

octadecenylamine, dihexylamine, dicyclohexylamine, di-(2-ethylhexyl)amine, ditridecylamine, octamethylenediamine, 4,4'-diaminodicyclohexylmethane, 3,3'-dimethyl-4,4'-diamino-dicyclohexylmethane), 1,4-diaminocyclohexane, 1,12-diaminododecane, isophorone diamine, 1,3-bis-(aminomethyl)cyclohexane, 1,3-bis-
 5 (aminoethyl)cyclohexane, aminoalkyl piperazines (e.g. 1,4-bis-(3-aminopropyl)piperazine), glucamines;

etheramines: 2-alkyloxyethylamines (e.g. 2-methoxyethylamine), 3-alkyloxypropylamines (e.g. 3-methoxypropylamine, 3-ethoxypropylamine, 3-(2-ethylhexoxy)propylamine), 4,7,10-trioxatridecane-1,13-diamine, 4,9-
 10 dioxadodecane-1,12-diamine, di-(2-methoxyethyl)amine;

ethylene- and propylene-amines: 2-(diethylamino)ethylamine, 2-(diisopropylamino)ethylamine, diethylenetriamine, triethylenetetramine, tetraethylenepentamine, 2,2',2''-triaminotriethylamine, N-(2-aminoethyl)ethanolamine, dipropylene triamine, 3-(dimethylamino)propylamine, 3-
 15 (alkylamino)propylamines (e.g. 3-(cyclohexylamino)-propylamine, 3-(oleylamino)-propylamine), 3-(2-aminoethylamino)-propylamine, N,N-bis-(3-aminopropyl)methylamine, linear or branched bis-(aminoalkyl) alkyl diamines (e.g. N,N'-bis-(3-aminopropyl)-ethylenediamine, N,N'-bis-(3-aminopropyl)-1,3-propanediamine);

20 amino acids and derivatives: tyrosine, tryptophane, lysine, glutamic acid, glutamine, aspartic acid, arginine, asparagine, phenylalanine, proline, glycine, serine, histidine, threonine, methionine, tyrosine ethylate, glycine methylate, tryptophane ethylate;

polyamines: primary and secondary polyetheramines (Jeffamine TM),
 25 polyethyleneimines (Lupasol TM), polypropyleneimines (Astramol TM), polyamidoamines, polyamino acids (e.g. polylysine, cross-linked polylysine),

polyvinylamines, poly(ethylene glycol) bis(amine), amino substituted polyvinylalcohols;

N-(3-aminopropyl)imidazole, nipecotamide, skatole and indole.

Methyl 2-amino-benzoate

2-Amino-acetophenone

Aminobenzoates (II)

Indole: R = H
Skatol: R = Me

- 5 These preferred amine compounds are substantially odourless or have only slight but not significant odours, and so constitute substantially odourless materials. Alternatively, they are known or new perfume ingredients and can therefore contribute in a pleasant way to the odour properties of the overall fragrance, when released from the reaction mixture.
- 10 A particularly preferred amino compound is methyl ortho-aminobenzoate (methyl anthranilate). With that amino compound, an olfactively most attracting fragrance precursor may be obtained by the reaction of the amine compound and 3-(4-isobutyl-2-methylphenyl)propanal in a molar ratio in a range between 2:1 to 1:1. Such reaction mixtures give at least (E/Z)-methyl 2-((3-(4-isobutyl-2-
- 15 methylphenyl)prop-1-en-1-yl)amino)benzoate and/or dimethyl 2,2'-((3-(4-isobutyl-2-methylphenyl)propane-1,1-diyl)bis(azanediyl))-dibenzoate.

Furthermore, the precursors are substantially odourless or have pleasant odour characteristics that may improve odour properties of the overall fragrance, respectively. It is important that the odour properties of the overall fragrance are

20 not affected, or are not adversely affected, by the presence of the reaction product.

In another of its aspects, the invention provides the use of the described fragrance precursor, that is at least the aminal and/or enamine of 3-(4-isobutyl-2-methylphenyl)propanal, as a perfume ingredient.

Usually, the crude reaction mixture is used as said fragrance precursor. In a particular embodiment, the crude reaction mixture may be purified before use as fragrance precursor.

In particular, the precursor as perfume ingredient can release an ingredient with muguet odour characteristics.

As such, and in contradistinction to the prior art proposals related to LilialTM replacement based on mixtures of known ingredients, the present invention provides a precursor that can release a single fragrance compound for a LilialTM replacement. Such a replacement by a single fragrance might be cost-effective and convenient for a perfumer.

The invention provides in another of its aspects the use of the described fragrance precursor in a perfume composition that is able to release 3-(4-isobutyl-2-methylphenyl)propanal as a replacement for aryl-substituted alkanals, more particularly aryl-substituted propanal odourants that are unsubstituted on the aryl ring at a position *ortho* to the substituent bearing the aldehyde functionality, in particular LilialTM.

The compound released by the precursor of the present invention is not susceptible to enzymatic degradation to its benzoic acid derivative. This was indeed a very surprising result considering the close structural similarity to LilialTM. The applicant's surprising discovery that an aryl-substituted alkanal containing a methyl substituent on the ring at a position *ortho* to the group bearing the aldehyde functionality is not susceptible to enzymatic degradation to its benzoic acid derivative, provides an insight heretofore not known in the art, and allows

perfumers to formulate with a compound that although being structurally similar to LilialTM (and therefore possessing remarkably similar olfactive properties as these compounds), nevertheless does not raise similar regulatory issues.

In order to study *in vitro* metabolism in rat hepatocytes LilialTM and the compound
5 released by the precursors of the present invention are incubated in presence of rat hepatocytes in suspension. Decrease of LilialTM and the compound released by the precursor of the present invention, and formation of the corresponding benzoic acid derivative may be analysed by GC-MS.

Accordingly, in another aspect of the present invention there is provided a
10 fragrance precursor that is able to release a compound of formula (I) that forms no, or substantially no, corresponding benzoic acid derivative when incubated with hepatocytes isolated from rats. By "substantially no benzoic acid derivative" is meant that the concentration of said derivative is below the limit of detection, i.e. <1%. As such, the precursor releasing the compound of formula (I) provides
15 perfumers with an eminently suitable surrogate for the valuable yet problematic LilialTM.

In another aspect of the invention there is provided a method of imparting a muguet odour characteristic to a perfume composition, said method comprising the step of incorporating a fragrance precursor releasing the compound of formula (I)
20 into said perfume composition.

In yet another aspect of the invention there is provided a perfume composition comprising a fragrance precursor, that is an aminal and/or enamine of 3-(4-isobutyl-2-methylphenyl)propanal.

In yet another aspect of the invention there is provided a perfume composition
25 possessing muguet odour characteristics comprising a fragrance precursor releasing a compound according to the formula (I).

In yet another aspect of the present invention there is provided a perfume composition comprising a fragrance precursor, that is an aminal and/or enamine of 3-(4-isobutyl-2-methylphenyl)propanal, that is substantially free of aryl-substituted propanal odourants that are unsubstituted on the aryl ring at a position *ortho* to
5 the substituent bearing the aldehyde functionality, in particular LilialTM.

A perfume composition according to the present invention can be made up entirely by the fragrance precursor, that is an aminal and/or enamine of 3-(4-isobutyl-2-methylphenyl)propanal. However, a perfume composition may also contain, in addition to the said fragrance precursor, one or more additional perfume
10 ingredients.

The fragrance precursor, that is an aminal and/or enamine of 3-(4-isobutyl-2-methylphenyl)propanal, may be present in a perfume composition in any amount depending on the particular olfactive effect that a perfumer wishes to achieve. In a particular embodiment of the present invention, a perfume composition of the
15 present invention may contain the fragrance precursor, that is an aminal and/or enamine of 3-(4-isobutyl-2-methylphenyl)propanal in an amount of 0.1 to 100 % by weight of said composition.

It is particularly preferred, that the perfume composition further comprises 3-(4-isobutyl-2-methylphenyl)propanal. The mixture of the fragrance and a precursor
20 releasing said fragrance ensures a constant and long-lasting fragrance impression over time.

The perfume composition may further comprise additional perfume ingredients. If one or more additional perfume ingredients are employed, they may be selected from any known perfume ingredients or from their precursor systems, respectively.

25 In particular, said perfume ingredients that may be employed in a perfume composition according to the invention include (E/Z)-9-hydroxy-5,9-dimethyldec-4-

enal, 6-methoxy-2,6-dimethylheptan-1-al (methoxymelonal), 5,9-dimethyl-4,8-decadienal (geraldehyde), beta-methyl-3-(1-methylethyl)benzenepropanal (florhydral), octahydro-8,8-dimethylnaphthalene-2-carbaldehyde (cyclomyral), alpha-methyl-1,3-benzodioxole-5-propionaldehyde (helional), 5-methyl-2-(1-methylbutyl)-5-propyl-1,3-dioxan (Troenan), 3-(o-ethylphenyl)-2,2-dimethylpropionaldehyde (floralozone), farnesol, 3,7,11-trimethyldodeca-1,6,10-trien-3-ol, optionally as an isomeric mixture (nerolidol), 2-methyl-4-phenylbutan-2-ol (dimethylphenylethylcarbinol), cis-4-(isopropyl)cyclohexanemethanol (mayol), 1-(1-hydroxyethyl)-4-(1-methylethyl)cyclohexane (optionally as a mixture of the diastereoisomers) (mugetanol), (4-methyl-3-pentenyl)cyclohexenecarbaldehyde (citrusal), cyclohexyl salicylate, hexyl salicylate, benzyl salicylate, amyl salicylate, 3-(p-(2-methylpropyl)phenyl)-2-methylpropionaldehyde (silvial), 3-p-cumenyl-2-methylpropionaldehyde (cyclamenaldehyde), mixtures of: cis-tetrahydro-2-isobutyl-4-methylpyran-4-ol; trans-tetrahydro-2-isobutyl-4-methylpyran-4-ol; triethyl citrate and dipropylene glycol.

Said perfume ingredients may additionally include Amyl Salicylate (2050-08-0); Aurantol[®] (89-43-0); Benzyl Salicylate (118-58-1); Cis-3-hexenyl Salicylate (65405-77-8); Citronellyl Oxyacetaldehyde (7492-67-3); Cyclemax (7775-00-0); Cyclohexyl Salicylate (25485-88-5); Cyclomyral[®] (68738-94-3); Citronellol (106-22-9); Geraniol (106-24-1); Cyclopentol Hc 937165 (84560-00-9); Cymal (103-95-7); Dupical (30168-23-1); Ethyl Linalool (10339-55-6); Floral Super (71077-31-1); Florhydral[®] (125109-85-5); Florol[®] (63500-71-0); Gyrane (24237-00-1); Hexyl Salicylate (6259-76-3); Helional (TM) (1205-17-0); Hydroxycitronellal (107-75-5); Linalool (78-70-6); Lyrall[®] (31906-04-4); Majantol[®] (103694-68-4); Mayol[®] (13828-37-0); Melafleur (68991-97-9); Melonal (106-72-9); Mugetanol (63767-86-2); Muguesia (56836-93-2); Muguet alcohol (13351-61-6); Verdantol (91-51-0); Peonile[®] (10461-98-0); Phenoxanol[®] (55066-48-3); Rossitol[®] (215231-33-7); Silvial[®] (6658-48-6); Suzural (6658-48-6); Muguol[®] (18479-57-7); Tetrahydro

Linalol (78-69-3); Acalea (84697-09-6); Dihydro Iso Jasmonate (37172-53-5);
 Hexyl Cinnamic Aldehyde (101-86-0); Hedione ® (24851-98-7); Acetoin (513-86-

 the figures in parentheses are CAS numbers.

A perfume composition need not be limited to the perfume ingredients listed
 above. Other perfume ingredients commonly used in perfumery may be employed,
 for example any of those ingredients described in "Perfume and Flavour
 25 Chemicals", S. Arctander, Allured Publishing Corporation, 1994, IL, USA, which is
 incorporated herein by reference, including essential oils, plant extracts, absolutes,
 resinoids, odourants obtained from natural products and the like.

The perfume ingredients contained in said perfume compositions are described above, but of course, the perfume mixture may not be limited to the stated ingredients. In particular, perfume compositions may comprise adjuvants that are commonly employed in perfume compositions. The term "adjuvants" refers to 5 ingredients that might be employed in a perfume composition for reasons not specifically related to the olfactive performance of said composition. For example, an adjuvant may be an ingredient that acts as an aid to processing a perfume ingredient or ingredients, or a composition containing said ingredient(s), or it may improve handling or storage of a perfume ingredient or composition containing 10 same. It might also be an ingredient that provides additional benefits such as imparting colour or texture. It might also be an ingredient that imparts light resistance or chemical stability to one or more ingredients contained in a perfume ingredient or composition containing same. A detailed description of the nature and type of adjuvants commonly used in perfume compositions containing same 15 cannot be exhaustive, but it has to be mentioned that said ingredients are well known to a person skilled in the art. Examples of adjuvants include solvents and co-solvents; surfactants and emulsifiers; viscosity and rheology modifiers; thickening and gelling agents; preservative materials; pigments, dyestuffs and colouring matters; extenders, fillers and reinforcing agents; stabilisers against the 20 detrimental effects of heat and light, bulking agents, acidulants, buffering agents and antioxidants.

Furthermore, any one or more of the perfume ingredients or adjuvants employed in the present invention might be formulated in a delivery vehicle if desired to provide a desired effect. Delivery vehicles may include encapsulates. Alternatively, 25 a delivery vehicle may be in the form of a solid support, e.g. a polymeric support material onto which one or more perfume ingredients or adjuvants may be chemically or physically bound. Still further, one or more perfume ingredients or adjuvants may be dissolved or dispersed in a matrix material, which serves to

control the rate at which said ingredient or ingredients emanates therefrom. In yet an alternative embodiment, one or more ingredients or adjuvants may be supported on a porous substrate, such as a cyclodextrin or a zeolite or other inorganic material. In a still further embodiment, one or more perfume ingredients
5 may be provided in the form of a pro-perfume or precursor, which will react in a suitable environment to release the perfume ingredient in a controlled manner.

Having regard to the foregoing, it will be appreciated that a perfume composition may be at least partly in solid form, in gel form, in foam form and/or liquid form. If it is present in solid form, it then it may take the form of granules, powders or
10 tablets.

The reaction product of a primary and/or secondary amine compound and 3-(4-isobutyl-2-methylphenyl)propanal, or perfume compositions described herein, may be employed to add a characteristic odour, in particular a muguet odour, to all manner of personal care and household care compositions, that will be released
15 with time.

According to another aspect of the present invention there is provided a method of imparting muguet odour characteristics to a composition comprising the step of adding to said composition a precursor releasing a compound according to formula (I) or a perfume composition containing said precursor.

20 A precursor as a perfume ingredient, or when used in perfume compositions can generate particularly substantive and long-lasting muguet odour characteristics.

The compound of formula (I), released by the precursor, is a particularly impactful perfume ingredient. The impact that a perfume ingredient exerts is related to its Odour Value. Odour Value is the ratio of vapour pressure to detection threshold
25 concentration.

Consumer products such as personal and household care compositions include, but are not limited to a textile treatment product, an ironing aid, a cleaning cloth, a laundry detergent, a cleaning product, in particular, for hard and/or soft surfaces, a household cleaner, a care product, a wash care product, a laundry care product, 5 a room fragrancener, and air freshener, a conditioner, a colorant, a fabric conditioner, a conditioning substrate, a pharmaceutical, a crop protection product, a polish, a food, a cosmetic product, a fertilizer, a building material, an adhesive, a bleach, a decalcifier, an autocare product, floorcare product, cookercare product, leathercare product or furniture care product, a scourer, a disinfectant, a 10 fragrancener, a mold remover and/or a precursor of the aforementioned products.

The skilled person is fully aware of the applicability of perfume ingredients, and compositions to personal and house hold care compositions and a very detailed description of such compositions is not warranted here. However, specific compositions that can be mentioned include cleaning compositions; autocare 15 compositions; Cosmetic compositions; textile treatment compositions; and air freshener and air care compositions.

Cleaning products include:-

Toilet cleaners or lavatory cleaners, in other words, products for cleaning lavatory bowls and urinals, these products being supplied preferably in the form of 20 powders, blocks, tablets or liquids, preferably gels. Besides other typical ingredients such as surfactants, they generally include organic acids e.g., citric acid and/or lactic acid) or sodium hydrogen sulfate, amidosulfuric acid or phosphoric acid for removing limescale or urine scale;

Pipe-cleaning products or drain cleaners. These are typically strongly alkaline 25 products which serve in general to remove pipe blockages comprising organic materials-such as hair, fat, food residues, soap deposits, and the like. Additions of Al powder or Zn powder may serve for the formation of H₂ gas with an

effervescence effect. Possible ingredients are commonly alkalis, alkaline salts, oxidizing agents, and neutral salts. Supply forms in powder form preferably also include sodium nitrate and sodium chloride. Pipe-cleaning products in liquid form may preferably also include hypochlorite. There are also enzyme-based drain
5 cleaners as well. Acidic products are likewise possible;

Universal or all-purpose or general-purpose cleaners. These are cleaners which can be used universally for all hard surfaces in the household and in commerce that can be wiped down wet or damp. Generally speaking, they are neutral or slightly alkaline or slightly acidic products, especially liquid products. All-purpose or
10 general-purpose cleaners generally contain surfactants, builders, solvents and hydrotropes, dyes, preservatives, and the like;

All-purpose cleaners with special disinfectant properties. They additionally include active antimicrobial ingredients (e.g., aldehydes, alcohols, quaternary ammonium compounds, amphoteric surfactants, triclosan);

15 Sanitary cleaners. These are products for cleaning in bath and toilet. The alkaline sanitary cleaners are used preferably for removing fatty soiling, whereas the acidic sanitary cleaners are employed in particular, for removing limescale. Sanitary cleaners advantageously also have a considerable disinfectant action, particularly the strongly alkaline sanitary cleaners that contain chlorine;

20 Oven cleaners or grill cleaners which may be supplied in the form of gels or foam sprays. They generally serve for removing burnt-on or carbonized food residues. Oven cleaners are preferably given a strongly alkaline formulation using, for example, sodium hydroxide, sodium metasilicate, 2-aminoethanol. In addition they generally contain anionic and/or nonionic surfactants, water-soluble solvents, and,
25 in some cases, thickeners such as polycarboxylates and carboxymethylcellulose;

Metal polishes. These are cleaners for particular types of metal such as stainless steel or silver. Stainless steel cleaners preferably contain, besides acids (preferably up to 3% by weight, e.g., citric acid, lactic acid), surfactants (in particular, up to 5% by weight, preferably nonionic and/or anionic surfactants), and water, solvents
5 as well (preferably up to 15% by weight) to remove fatty soiling, and also further compounds such as thickeners and preservatives. Very fine polishing structures are included, furthermore, in products for preferably bright stainless steel surfaces. Silver polishes, in turn, may be provided in an acidic formulation. In particular, for removing black deposits of silver sulfide they contain, preferably, complexing
10 agents (e.g., thiourea, sodium thiosulfate). Typical supply forms are polishing cloths, dipping baths, pastes, and liquids. Dark discolorations (oxide layers) are removed using copper cleaners and nonferrous-metal cleaners (e.g., for brass and bronze). They generally have a weakly alkaline formulation (preferably with ammonia) and in general contain polishing agents and also, preferably, ammonium
15 soaps and/or complexing agents;

Glass cleaners and window cleaners. These products serve preferably to remove dirt, especially greasy dirt, from glass surfaces. Preferably they contain compounds such as anionic and/or nonionic surfactants (in particular, up to 5% by weight), ammonia and/or ethanolamine (in particular, up to 1% by weight), ethanol and/or
20 2-propanol, glycol ethers (in particular, 10-30% by weight), water, preservatives, dyes, anti-misting agents and the like; and

Special-purpose cleaning products, examples being those for glass-ceramic hobs, and also carpet cleaners and stain removers.

Autocare products include:-

25 Paint preservers, paint polishes, paint cleaners, wash preservers, shampoos for auto washing, auto-wash and wax products, polishes for trim metals, protective

films for trim metals, plastics cleaners, tar removers, screen cleaners, engine cleaners, and the like.

Cosmetic products include:-

(a) cosmetic skincare products, especially bath products, skin washing and
5 cleansing products, skincare products, eye makeup, lip care products, nail care products, intimate care products, foot care products;

(b) cosmetic products with specific effects, especially sunscreens, tanning products, de-pigmenting products, deodorants, antiperspirants, hair removers, shaving products, perfumes;

10 (c) cosmetic dental-care products, especially dental and oral care products, tooth care products, cleaners for dental prostheses, adhesives for dental prostheses; and

(d) cosmetic hair care products, especially hair shampoos, hair care products, hair setting products, hair-shaping products, and hair coloring products.

Textile treatment products include:-

15 Detergents or fabric conditioners, for example, in either liquid or solid form.

Air fresheners and room fragrances include:-

Products that contain preferably volatile and usually pleasant-smelling compounds which advantageously can even in very small amounts mask unpleasant odours.

Air fresheners for living areas contain, in particular, natural and synthetic essential
20 oils such as pine needle oils, citrus oil, eucalyptus oil, lavender oil, and the like., in amounts for example of up to 50% by weight. As aerosols they tend to contain smaller amounts of such essential oils, by way of example less than 5% or less than 2% by weight, but additionally include compounds such as acetaldehyde (in particular, <0.5% by weight), isopropyl alcohol (in particular, <5% by weight),
25 mineral oil (in particular, <5% by weight), and propellants. Other presentation

forms include sticks and blocks. They are produced typically using a gel concentrate comprising essential oils. It is also possible to add formaldehyde (for preservation) and chlorophyll (preferably <5% by weight), and also further ingredients. Air fresheners are not, however, restricted to living spaces, but may
5 also be intended for autos, cupboards, dishwashers, refrigerators or shoes, and even their use in vacuum cleaners is a possibility. In the household (e.g., in cupboards), for example, in addition to the odour improvers, disinfectants as well are employed, containing preferably compounds such as calcium phosphate, talc, stearin, and essential oils, these products taking the form, for example, of sachets.

- 10 Consumer product compositions referred to hereinabove, particularly those for use in washing or cleaning applications may contain one or more of the following substances:

Builder substances, surfactants, enzymes, bleaching agents, such as preferably organic and/or inorganic peroxygen compounds, peroxygen activators, water-
15 miscible organic solvents, sequestering agents, electrolytes, pH regulators, thickeners, and further adjuvants such as soil release active substances, optical brighteners, graying inhibitors, color transfer inhibitors, foam regulators, and dyes.

Surfactants include anionic surfactants, nonionic surfactants, and mixtures thereof, but also cationic surfactants, are appropriate. Suitable nonionic surfactants are, in
20 particular, ethoxylation and/or propoxylation products of alkyl glycosides and/or of linear or branched alcohols each having 12 to 18 carbon atoms in the alkyl portion and 3 to 20, by preference 4 to 10, alkyl ether groups. Also usable are corresponding ethoxylation and/or propoxylation products of N-alkylamines, vicinal diols, fatty acid esters and fatty acid amides that correspond, in terms of the alkyl
25 portion, to the aforesaid long-chain alcohol derivatives, and of alkylphenols having 5 to 12 carbon atoms in the alkyl residue.

Suitable anionic surfactants include soaps, and those that contain sulfate or sulfonate groups having preferably alkali ions as cations. Soaps include alkali salts of the saturated or unsaturated fatty acids having 12 to 18 carbon atoms. Such fatty acids can also be used in incompletely neutralized form. Included among the
 5 usable surfactants of the sulfate type are the salts of the sulfuric acid semi-esters of fatty alcohols having 12 to 18 carbon atoms, and the sulfated products of the aforesaid nonionic surfactants having a low degree of ethoxylation. Included among the usable surfactants of the sulfonate type are linear alkylbenzenesulfonates having 9 to 14 carbon atoms in the alkyl portion,
 10 alkanesulfonates having 12 to 18 carbon atoms, and olefinsulfonates having 12 to 18 carbon atoms that are produced upon reaction of corresponding monoolefins with sulfur trioxide, as well as alpha-sulfofatty acid esters that are produced upon sulfonation of fatty acid methyl or ethyl esters.

Cationic surfactants include esterquats and/or the quaternary ammonium
 15 compounds (QACs). QACs may be produced by the reaction of tertiary amines with alkylating agents such as methyl chloride, benzyl chloride, dimethyl sulfate, dodecyl bromide, but also ethylene oxide. The alkylation of tertiary amines having a long alkyl residue and two methyl groups occurs particularly easily, and the quaternization of tertiary amines having two long residues and one methyl group
 20 can also be carried out using methyl chloride under mild conditions. Amines that possess three long alkyl residues or hydroxy-substituted alkyl residues have low reactivity, and are quaternized, for example, using dimethyl sulfate. Suitable QACs are, for example, benzalkonium chloride (N-alkyl-N,N-dimethylbenzylammonium chloride), benzalkon B (m,p-dichlorobenzyltrimethyl-C12-alkylammonium chloride),
 25 benzoxonium chloride (benzyl-dodecyl-bis(2-hydroxyethyl)ammonium chloride), cetrimonium bromide (N-hexadecyl-N,N-trimethylammonium bromide), benzetonium chloride (N,N-dimethyl-N-[2-[2-[p-(1,1,3,3-tetramethylbutyl)phenoxy]ethoxy]ethyl]benzylammonium chloride),

dialkyldimethylammonium chlorides such as di-n-decyldimethylammonium chloride, didecyldimethylammonium bromide, dioctyldimethylammonium chloride, 1-cetylpyridinium chloride, and thiazoline iodide, as well as mixtures thereof. Preferred QACs are the benzalkonium chlorides having C8 to C22 alkyl residues, in particular C12 to C14 alkylbenzyldimethylammonium chloride.

Esterquats include the commercially available methylhydroxyalkyldialkoyloxyalkylammonium methosulfates marketed by the Stepan company under the trademark Stepantex™, or the products of Cognis Deutschland GmbH known under the trade name Dehyquat™, or the Rewoquat™ products of Goldschmidt-Witco.

10 Surfactants may be employed in amounts of 5 wt % to 50 wt % in a consumer product of the present invention.

Builders include the water-soluble and/or water-insoluble, organic and/or inorganic builders. In particular, they include the water-soluble organic builder substances are polycarboxylic acids, more particularly citric acid and sugar acids, monomeric and polymeric aminopolycarboxylic acids, in particular methylglycinediacetic acid, nitrilotriacetic acid, and ethylenediaminetetraacetic acid, as well as polyaspartic acid, polyphosphonic acids, in particular aminotris(methylenephosphonic acid), ethylenediaminetetrakis(methylenephosphonic acid), and 1-hydroxyethane-1,1-diphosphonic acid, polymeric hydroxy compounds such as dextrin, as well as polymeric (poly)carboxylic acids, polymeric acrylic acids, methacrylic acids, maleic acids, and mixed polymers thereof, which can also contain small proportions of polymerizable substances having no carboxylic-acid functionality. The relative molecular weight of homopolymers of unsaturated carboxylic acids is generally between 5000 and 200,000, that of the copolymers between 2000 and 200,000, based in each case on free acid. Suitable compounds of this class are copolymers of acrylic acid or methacrylic acid with vinyl ethers, such as vinylmethyl ethers, vinyl esters, ethylene, propylene, and styrene, in which the proportion of acid is

equal to at least 50 wt %. It is also possible to use, as water-soluble organic builder substances, terpolymers that contain two unsaturated acids and/or salts thereof as monomers and, as a third monomer, vinyl alcohol and/or a vinyl alcohol derivative or a carbohydrate. The first acid monomer or salt thereof may be
5 derived from an ethylenically mono-unsaturated C3 to C8 carboxylic acid. The second acid monomer or salt thereof can be a derivative of a C4 to C8 dicarboxylic acid, for example maleic acid. The third monomeric unit is constituted by vinyl alcohol and/or an esterified vinyl alcohol. Polymers may contain 60 wt % to 95 wt %, in particular 70 wt % to 90 wt %, (meth)acrylic acid or (meth)acrylate, as well
10 as 5 wt % to 40 wt % vinyl alcohol and/or vinyl acetate. Particular polymers are those in which the weight ratio of (meth)acrylic acid respectively (meth)acrylate to maleic acid or maleate is between 1:1 and 4:1. Both the quantities and the weight ratios are based on the acids. The second acid monomer or salt thereof can also be a derivative of an allylsulfonic acid that is substituted in the 2-position with an
15 alkyl radical, e.g. a C1 to C4 alkyl radical, or with an aromatic radical that may be derived from benzene or benzene derivatives. Terpolymers may contain 40 wt % to 60 wt %, in particular 45 to 55 wt %, (meth)acrylic acid or (meth)acrylate, particularly preferably acrylic acid or acrylate, 10 wt % to 30 wt %, by preference 15 wt % to 25 wt % methallylsulfonic acid or methallylsulfonate, and as a third
20 monomer 15 wt % to 40 wt %, by preference 20 wt % to 40 wt % of a carbohydrate. This carbohydrate can be, for example, a mono-, di-, oligo-, or polysaccharide, e.g. sucrose. The terpolymers generally have a relative molecular weight between 1000 and 200,000. Further copolymers include those that comprise, as monomers, acrolein and acrylic acid/acrylic acid salts, or vinyl
25 acetate. Especially for the manufacture of liquid detergents, the organic builder substances can be used in the form of aqueous solutions, for example a 30- to 50-weight-percent aqueous solutions. All the aforesaid acids may be used in the form of their water-soluble salts, in particular their alkali salts.

Organic builder substances can be employed in quantities of up to 40 wt %.

Water-soluble inorganic builder materials include alkali silicates and polyphosphates, e.g. sodium triphosphate. Crystalline or amorphous alkali aluminosilicates, e.g. crystalline sodium aluminosilicates, may also be employed as
5 water-insoluble, water-dispersible inorganic builder materials, in quantities of up to 50 wt %, for example. Aluminosilicates typically comprise particles having a particle size less than 30 [μ]m.

Crystalline alkali silicates may also be employed, either alone or used with amorphous silicates. The alkali silicates usable in consumer products of the present
10 invention as detergency builders may have a molar ratio of alkali oxide to SiO_2 below 0.95, in particular from 1:1.1 to 1:12, and can be present in amorphous or crystalline fashion. The alkali silicates may be sodium silicates, in particular the amorphous sodium silicates, having a $\text{Na}_2\text{O}:\text{SiO}_2$ molar ratio from 1:2 to 1:2.8.

Builder substances may be contained in consumer product compositions according
15 to the present invention at levels up to 60 wt %.

Peroxygen compounds include organic peracids or peracid salts of organic acids such as phthalimidopercapronic acid, perbenzoic acid, or salts of diperdodecanedioic acid, hydrogen peroxide, and inorganic salts that release hydrogen peroxide under application conditions, such as perborate, percarbonate,
20 and/or persilicate. If solid peroxygen compounds are to be used, they can be utilized in the form of powders or granulates, which in principle can also be encased in known fashion.

Peroxygen compounds may be employed in amounts up to 50 wt %. The addition of small quantities of known bleaching-agent stabilizers, for example
25 phosphonates, borates respectively metaborates, and metasilicates, as well as magnesium salts such as magnesium sulfate, may be useful.

Compounds that, under perhydrolysis conditions, yield aliphatic peroxocarboxylic acids having preferably 1 to 10 carbon atoms, in particular 2 to 4 carbon atoms, and/or (optionally substituted) perbenzoic acid, can be used as bleach activators. Substances that carry O- and/or N-acyl groups having the aforesaid number of 5 carbon atoms, and/or optionally substituted benzoyl groups, are suitable. Multiple acylated alkylenediamines, in particular tetraacetylenediamine (TAED), acylated triazine derivatives, in particular 1,5-diacetyl-2,4-dioxohexahydro-1,3,5-triazine (DADHT), acylated glycolurils, in particular tetraacetyl glycoluril (TAGU), N-acylimides, in particular N-nonanoyl succinimide (NOSI), acylated phenolsulfonates, 10 in particular n-nonanoyl or isononanoyl oxybenzenesulfonate (n- or iso-NOBS), carboxylic acid anhydrides, in particular phthalic acid anhydride, acylated polyvalent alcohols, in particular triacetin, ethylene glycol diacetate, 2,5-diacetoxy-2,5-dihydrofuran, and enol esters, as well as acetylated sorbitol and mannitol respectively mixtures thereof (SORMAN), acylated sugar derivatives, in particular 15 pentaacetylglucose (PAG), pentaacetylfructose, tetraacetylxylose and octaacetyllactose, as well as acetylated, optionally N-alkylated glutamine and gluconolactone, and/or N-acylated lactams, for example N-benzoylcaprolactam, may be employed. Hydrophilically substituted acyl acetates and acyl lactams may likewise be employed. Combinations of conventional bleach activators can also be 20 used. Such bleach activators can be contained in the usual quantity range, by preference in quantities from 1 wt % to 10 wt %, in particular 2 wt % to 8 wt %, based on the entire agent.

In addition to or instead of the aforementioned conventional bleach activators, sulfonimines and/or bleach-intensifying transition metal salts or transition metal 25 complexes can also be contained as bleach catalysts. Included among the appropriate transition metal compounds are, in particular, salen complexes of manganese, iron, cobalt, ruthenium, or molybdenum and nitrogen-analog compounds thereof, carbonyl complexes of manganese, iron, cobalt, ruthenium, or

molybdenum, complexes of manganese, iron, cobalt, ruthenium, molybdenum, titanium, vanadium, and copper having nitrogen-containing tripod ligands, amine complexes of cobalt, iron, copper, and ruthenium. Combinations of bleach activators and transition metal bleach catalysts can likewise be used. Bleach-
5 intensifying transition metal complexes, in particular having the central atoms Mn, Fe, Co, Cu, Mo, V, Ti, and/or Ru, can be used in conventional quantities, such as up to 1 wt % based on the weight of the consumer product composition.

Suitable enzymes that may be employed in consumer product compositions are those from the class of the proteases, cutinases, amylases, pullulanases,
10 hemicellulases, cellulases, lipases, oxidases, and peroxidases, as well as mixtures thereof. Enzymatically active substances recovered from fungi or bacteria, such as *Bacillus subtilis*, *Bacillus licheniformis*, *Streptomyces griseus*, *Humicola lanuginosa*, *Humicola insolens*, *Pseudomonas pseudoalcaligenes*, or *Pseudomonas cepacia*, are also suitable. The enzymes that are used as applicable can be adsorbed onto
15 carrier substances and/or embedded into encasing substances in order to protect them from premature inactivation. They may be contained in washing products according to the present invention in amounts typically below 5 wt %.

Optical brighteners include derivatives of diaminostilbenedisulfonic acid or alkali metal salts thereof. Suitable, for example, are salts of 4,4'-bis(2-anilino-4-
20 morpholino-1,3,5-triazinyl-6-amino)stilbene-2,2'-disulfonic acid, or compounds of similar structure that carry, instead of the morpholino group, a diethanolamino group, a methylamino group, an anilino group, or a 2-methoxyethylamino group. Brighteners of the substituted diphenylstyryl type can also be present, e.g. the alkali salts of 4,4'-bis(2-sulfostyryl)diphenyl, of 4,4'-bis(4-chloro-3-
25 sulfostyryl)diphenyl, or of 4-(4-chlorostyryl)-4'-(2-sulfostyryl)diphenyl. Mixtures of the aforesaid optical brighteners can also be used.

Foam inhibitors include organopolysiloxanes and mixtures thereof with microfine, optionally silanated silicic acid, as well as paraffin waxes and mixtures thereof with silanated silicic acid or bis-fatty acid alkylenediamides. Mixtures of different foam inhibitors, for example those made of silicones, paraffins, or waxes, can also be employed. The foam inhibitors, in particular silicone- and/or paraffin-containing foam inhibitors are by preference bound to a granular carrier substance that is soluble or dispersible in water. Mixtures of paraffins and bistearylethylenediamide, in particular may be employed.

Soil release active substances are those compounds that positively influence the ability of oils and fats to be washed out of textiles. This effect becomes particularly apparent when the soiled textile is one that has already been previously washed several times with a washing agent according to the present invention that contains this oil- and fat-releasing component. The preferred oil- and fat-releasing components include, for example, nonionic cellulose ethers such as methyl cellulose and methylhydroxypropyl cellulose having a 15 to 30 wt % proportion of methoxy groups and a 1 to 15 wt % proportion of hydroxypropoxyl groups, based in each case on the nonionic cellulose ethers, as well as polymers, known from the existing art, of phthalic acid and/or terephthalic acid resp. of their derivatives with monomeric and/or polymeric diols, in particular polymers of ethylene terephthalates and/or polyethylene glycol terephthalates or anionically and/or nonionically modified derivatives thereof.

Colour transfer inhibitors include polymers of vinylpyrrolidone, vinylimidazole, vinylpyridine-N-oxide, or copolymers thereof. Also usable are both polyvinylpyrrolidones having molecular weights from 15,000 to 50,000 and polyvinylpyrrolidones having molecular weights above 1,000,000, in particular from 1,500,000 to 4,000,000, N-vinylimidazole/N-vinylpyrrolidone copolymers, polyvinylloxazolidones, copolymers based on vinyl monomers and carboxylic acid amides, pyrrolidone-group-containing polyesters and polyamides, grafted

polyamidoamines and polyethylenimines, polymers having amide groups made up of secondary amines, polyamine-N-oxide polymers, polyvinyl alcohols, and copolymers based on acrylamidoalkenyl sulfonic acids. It is also possible, however, to use enzymatic systems encompassing a peroxidase and hydrogen peroxide or a
5 substance that yields hydrogen peroxide in water.

Graying inhibitors are those materials that keep dirt that has been detached from the textile fibers suspended in a washing medium. Water-soluble colloids, usually organic in nature, are suitable for this, for example starch, size, gelatin, salts of ethercarboxylic or ethersulfonic acids of starch or of cellulose, or salts of acid
10 sulfuric acid esters of cellulose or of starch. Water-soluble polyamides containing acid groups are also suitable for this purpose. Starch derivatives other than those recited above can also be used, for example aldehyde starches. Cellulose ethers such as carboxymethyl cellulose (sodium salt), methyl cellulose, hydroxyalkyl cellulose, and mixed ethers such as methylhydroxyethyl cellulose,
15 methylhydroxypropyl cellulose, methylcarboxymethyl cellulose, and mixtures thereof may be used, for example in quantities from 0.1 to 5 wt % based on the weight of the consumer product.

Organic solvents include alcohols having 1 to 4 carbon atoms, in particular methanol, ethanol, isopropanol, and tert-butanol, diols having 2 to 4 carbon atoms,
20 in particular ethylene glycol and propylene glycol, as well as mixtures thereof, and the ethers derivable from the aforesaid compound classes. Water-miscible solvents of this kind are present in washing products according to the present invention in amounts typically not exceeding 30 wt %.

pH regulators include citric acid, acetic acid, tartaric acid, malic acid, lactic acid,
25 glycolic acid, succinic acid, glutaric acid, and/or adipic acid, but also mineral acids, in particular sulfuric acid, or bases, in particular ammonium hydroxides or alkali hydroxides. pH regulators of this kind are contained in the agents according to the

present invention in quantities preferably not above 20 wt %, in particular from 1.2 wt % to 17 wt %.

The precursor of the present invention may be particularly used to perfume household products containing enzymes, such as those defined above, and in
5 particular textile treatment products, such as detergents, containing enzymes.

The invention is now further described with reference to the following non-limiting examples. These examples are for the purpose of illustration only and it is understood that variations and modifications can be made by one skilled in the art.

General: The compounds of the present invention have been prepared in one step
10 by mixing a fragrant aldehyde and an amine. The reaction can be carried out without solvent at a temperature preferably between 65-80 °C under a pressure of 30-80 mbar and a reaction time of 3-7 h. Alternatively, the reaction is conducted in a round bottom flask together with molecular sieve (3-4 Å) under atmospheric pressure and at a temperature between 65-80 °C. The products were used without
15 further purification. NMR spectra were measured in CDCl₃ and are reported relative to TMS (¹H NMR) as follows: chemical shifts (δ ppm), coupling constants *J* in Hz. Solid probe MS analyses were run on a SSQ 7000 Thermo mass spectrometer and are reported as m/z list (relative intensity).

20 Example 1: Mixing methyl 2-aminobenzoate and 3-(4-isobutyl-2-methylphenyl)propanal (molar ratio 1:1)

A mixture of methyl 2-aminobenzoate (1.51 g, 10.0 mmol) and 3-(4-isobutyl-2-methylphenyl)-propanal (2.04 g, 10.0 mmol) was stirred at 75 °C and 50 mbar for 6 h to yield, after cooling to 25 °C, 3.17 g of a bright yellow oil. No purification was needed as the product will be used in perfumery applications as is. Analysis of the crude reaction mixture revealed two major components, "enamine" (E/Z)-methyl 2-((3-(4-isobutyl-2-methylphenyl)prop-1-en-1-yl)amino)benzoate and "aminal" dimethyl 2,2'-((3-(4-isobutyl-2-methylphenyl)propane-1,1-diyl)bis(azanediyl))-dibenzoate (molar ratio enamine/aminal = 3:1).

(E/Z)-Methyl 2-((3-(4-isobutyl-2-methylphenyl)prop-1-en-1-yl)amino)benzoate:

^1H NMR (CDCl_3 , 400 MHz); mixture of E/Z isomers: δ = 9.85 (br d, J = 11.0 Hz, NH), 9.59 (br d, J = 10.8 Hz, NH), 7.94 (dd, J = 8.1, 1.5 Hz, 1H), 7.89 (dd, J = 8.1, 1.5 Hz, 1H), 7.38 (dddd, J = 8.8, 7.1, 1.7, 0.5 Hz, 1H), 7.33 (dddd, J = 9.1, 7.1, 2.5, 0.7 Hz, 1H), 7.15 (d, J = 7.6 Hz, 1H), 7.09 (d, J = 8.3 Hz, 1H), 7.02-6.84 (m, 4H), 6.70 (ddd, J = 8.1, 7.1, 1.0 Hz, 1H), 6.67-6.44 (m, 5H), 5.28 (dt, J = 13.5, 6.9 Hz, 1H), 4.72 (dtd, J = 8.3, 7.3, 0.7 Hz, 1H), 3.87 (s, 3H), 3.85 (s, 3H), 3.47 (dd, J = 7.1, 1.5 Hz, 2H), 3.36 (dd, J = 6.9, 0.7 Hz, 2H), 2.41 (d, J = 7.1 Hz, 2H), 2.41 (d, J = 7.1 Hz, 2H), 2.31 (s, 3H), 2.30 (s, 3H), 1.89-1.78 (m, 2H), 0.90 (d, J = 6.6 Hz, 6H), 0.90 (d, J = 6.6 Hz, 6H) ppm. ^{13}C NMR (CDCl_3 , 100 MHz); mixture of E/Z isomers: δ = 168.9 (s), 168.8 (s), 146.6 (s), 146.5 (s), 139.5 (s),

Dimethyl 2,2'-((3-(4-isobutyl-2-methylphenyl)propane-1,1-diyl)bis(azanediyl))-dibenzoate:

¹H NMR (CDCl₃, 400 MHz): δ = 8.11 (br d, *J* = 6.6 Hz, 2NH), 7.91 (dd, *J* = 8.1, 1.7 Hz, 2H), 7.27-7.23 (m, 2H), 7.02 (d, *J* = 7.6 Hz, 1H), 6.92 (d, *J* = 1.7 Hz, 1H), 6.88 (dd, *J* = 7.8, 1.7 Hz, 1H), 6.63-6.59 (m, 2H), 6.52 (d, *J* = 8.6 Hz, 2H), 4.99 (quint, *J* = 6.4 Hz, 1H), 3.81 (s, 6H), 2.83 (t, *J* = 7.7 Hz, 2H), 2.40 (d, *J* = 7.1 Hz, 2H), 2.23 (s, 3H), 2.19-2.14 (m, 2H), 1.83 (non, *J* = 6.6 Hz, 1H), 0.89 (d, *J* = 6.6 Hz, 6H) ppm. ¹³C NMR (CDCl₃, 100 MHz): δ = 168.8 (2s), 149.3 (2s), 139.5 (s), 136.1 (s), 135.5 (s), 134.6 (2d), 131.7 (2d), 131.1 (d), 128.6 (d), 126.6 (d), 115.3 (2d), 111.7 (2d), 110.5 (2s), 62.2 (d), 51.4 (2q), 44.9 (t), 36.0 (t), 30.1 (d), 28.4 (t), 22.3 (2q), 19.1 (q) ppm. MS (EI): 488 (2, [M]⁺•), 338 (84), 337 (95, [M]⁺•-•NH(C₆H₄)CO₂CH₃), 322 (13), 306 (12), 262 (14), 186 (31), 161 (23), 151 (100), 143 (64), 131 (41), 120 (23), 119 (76), 92 (27), 57 (20).

Odour description of the crude reaction mixture: floral aldehydic, floral orange flower, methyl anthranilate, slightly green latex

Example 2: Mixing methyl 2-aminobenzoate and 3-(4-isobutyl-2-methylphenyl)propanal (molar ratio 2:1)

A mixture of methyl 2-aminobenzoate (3.02 g, 20.0 mmol) and 3-(4-isobutyl-2-methylphenyl)-propanal (2.04 g, 10.0 mmol) was stirred at 75 °C and 50 mbar for 6 h to yield, after cooling to 25 °C, 4.60 g of a bright yellow oil. No purification was needed as the product will be used in perfumery applications as is. Analysis of the
 5 crude reaction mixture revealed two major components, "aminal" dimethyl 2,2'-((3-(4-isobutyl-2-methylphenyl)propane-1,1-diyl)bis-(azanediyl))dibenzoate and "enamine" (E/Z)-methyl 2-((3-(4-isobutyl-2-methylphenyl)prop-1-en-1-yl)amino)benzoate (molar ratio aminal/enamine = 2:1).

Spectral data of dimethyl 2,2'-((3-(4-isobutyl-2-methylphenyl)propane-1,1-diyl)bis-
 10 (azanediyl))dibenzoate and (E/Z)-methyl 2-((3-(4-isobutyl-2-methylphenyl)prop-1-en-1-yl)amino)benzoate are reported in Example 1.

Odour description of the crude reaction mixture: floral orange flower, floral aldehydic, methyl anthranilate

15 Example 3: Preparation of a Feminine Floral Fine Fragrance

Compound / Ingredient	parts by weight 1/900
Benzyl acetate	40
2-Phenylethanol	20
Decanal (at 10% in DPG)	8
20 10-Undecenal (at 10% in DPG)	8
Baume Perou Ess	25
Bergamote Ess	45
Coumarin	20
Methyl 2,4-dihydroxy-3,6-dimethyl benzoate (Evernyl)	3
25 1-Phenylethyl acetate (Gardenol)	35

	Geranium Ess	2
	Ethyl 2-ethyl-6,6-dimethyl-2-cyclohexenecarboxylate & Ethyl 2,3,6,6-tetramethyl-2-cyclohexenecarboxylate (Givescone)	100
	Methyl 2-(3-oxo-2-pentylcyclopentyl)acetate (Hedione)	70
5	(3 <i>E</i>)-4-(2,6,6-trimethylcyclohex-1-en-1-yl)but-3-en-2-one (Ionone beta)	25
	Jasmin absolute	2
	(<i>Z</i>)-3-Methyl-2-(pent-2-enyl)cyclopent-2-enone (cis-Jasmone)	5
	Lentisque oil	8
	Musk ketone (Low MX)	4
10	2-Methylundecanoic acid (Mystikal) (at 1% in DPG)	1
	Neroli oil bigarde	30
	γ -Undecalactone	7
	(3,7-Dimethylocta-1,6-dien-3-yl)-dimethylcarbamate (Pepperwood)	20
	(<i>E</i>)-2-Methyl-4-(2,2,3-trimethyl-1-cyclopent-3-enyl)-but-2-en-1-ol	25
15	6-Ethyl-3-methyl-6-octen-1-ol (Super Muguet)	25
	Methyl cedryl ketone	200
	Dipropylene glycol (DPG)	122
	<u>Product from Example 2</u>	<u>50</u>
		Total: 900

20

The addition of the reaction mixture comprising at least dimethyl 2,2'-((3-(4-isobutyl-2-methylphenyl)propane-1,1-diyl)bis-(azanediyl))dibenzoate and (E/Z)-methyl 2-((3-(4-isobutyl-2-methylphenyl)prop-1-en-1-yl)amino)-benzoate (as prepared in Example 2) nicely wraps the green character of the composition,

25 provides a muguet and orange flower facet and increases the creaminess. At the

same time, the product adds volume, diffusion and performance to the whole composition.

Example 4: Preparation of a Feminine Floral Aldehydic Fine Fragrance

5	<u>Compound / Ingredient</u>	<u>parts by weight 1/900</u>
	Decanal (at 10% in DPG)	8
	10-Undecenal (at 10% in DPG)	8
	2-Methylundecanal (at 10% in DPG)	3
	Allyl amyl glycolate	2
10	(1 <i>R</i> ,2 <i>S</i> ,2' <i>S</i> ,4 <i>R</i>)-1,7,7-Trimethyl-2'-(1-methylethyl)spiro[bicyclo[2.2.1]heptane-2,4'-[1,3]dioxane] (Belambre) (at 50% in IPM)	8
	6-Methoxy-2,6-dimethyloctanal (Calypsone)	20

	1-(Cyclopropylmethyl)-4-methoxybenzene (Toscanol)	4
	3-Methoxy-4-hydroxybenzaldehyd (Vanillin)	15
	Dipropylene glycol (DPG)	188
	<u>Product from Example 1</u>	<u>15</u>
15		Total: 900

The addition of the reaction mixture comprising at least (E/Z)-methyl 2-((3-(4-isobutyl-2-methylphenyl)prop-1-en-1-yl)-amino)benzoate and dimethyl 2,2'-((3-(4-isobutyl-2-methylphenyl)propane-1,1-diyl)bis-(azanediyl))dibenzoate (as prepared

20 in Example 1) leads to a more sophisticated accord by reducing the sharpness of the aldehydes and by providing an orange flower note together with a muguet facet. The product blends very well with Pepperwood, Mystikal and Pomarose and adds volume, diffusion and performance to the whole composition.

Claims:

1. A fragrance precursor of 3-(4-isobutyl-2-methylphenyl)propanal, comprising at least an enamine and/or an aminal as reaction product of 3-(4-isobutyl-2-methylphenyl)propanal and a primary and/or secondary amine.
- 5 2. A fragrance precursor according to claim 1, wherein the primary and/or secondary amine is selected from the group consisting of aromatic amines, in particular methyl 2-aminobenzoate (methyl anthranilate), 2-aminoacetophenone, ortho, meta or para aminobenzoates of formula II (wherein R^1 = C1-C12 linear or branched alkyl, alkenyl, cycloalkyl, cycloalkenyl or alkylaryl and R^2 = H, Me, Et); primary or secondary aliphatic amines, preferably C8-C30 linear or branched alkylamines or alkyldiamines; etheramines; ethylene- and propylene-amines; amino acids and derivatives; polyamines, in particular primary and secondary polyetheramines, polyethyleneimines, polypropyleneimines, polyamidoamines, polyamino acids, polyvinylamines, poly(ethylene glycol) bis(amine), amino substituted polyvinylalcohols; N-(3-aminopropyl)imidazole, nipecotamide, skatole and indole

3. A fragrance precursor according to claim 1 or 2, comprising at least (E/Z)-methyl 2-((3-(4-isobutyl-2-methylphenyl)prop-1-en-1-yl)amino)benzoate and/or dimethyl 2,2'-((3-(4-isobutyl-2-methylphenyl)propane-1,1-diyl)bis(azanediyl))-dibenzoate.

4. Use of a fragrance precursor according to any of the claims 1 through 3 as a perfume ingredient.
5. The use of the fragrance precursor according to claim 4, wherein the perfume ingredient can release an ingredient with muguet odour characteristics.
6. A perfume composition comprising a fragrance precursor according to any of the claims 1 through 3.
7. A perfume composition according to claim 6 that is substantially free of aryl-substituted propanals that are unsubstituted on the aryl ring at a position ortho to the substituent bearing the aldehyde functionality, in particular Lilial TM.
8. A perfume composition according to claim 6 or claim 7 further comprising 3-(4-isobutyl-2-methylphenyl)propanal.
9. A perfume composition according to any of the claims 6 through 8 comprising one or more additional fragrance ingredients.
10. A perfume composition according to any of the claims 6 through 9, which can release an ingredient with muguet odour characteristics.
11. A personal care or household care composition comprising at least a fragrance precursor according to any of the claims 1 to 3, or a perfume composition as defined in any of the claims 6 through 10.
12. A method of imparting a muguet odour characteristic to a perfume composition comprising the step of adding to said composition at least a fragrance precursor according to any of the claims 1 to 3.
