Abstract

A map, in particular country map, road map, city map or otherwise printed map comprised of a fan and cross-folded, printed map sheet made of paper sheet and a transparent plastic film applied as a laminate or lining on the front and on the reverse side of the map sheet, has a new construction to allow for mechanical lining and folding. One embodiment of the map is characterized in that the fold lines of the fanfold are predefined by embossed grooves in the map sheet and wherein an elongate opening 2 - 20 mm in width is formed in the region of a cross fold extending perpendicular to the fan fold lines of the map sheet, said elongate opening is overlapped by the plastic films, and that at a narrow side of the opening in extension of the latter a web of the same width as the opening is left which is delimited on either side by an embossed groove and which is imprintable with a map title, the printed image of the map being interrupted in the region between the two embossed grooves and the elongate opening. Another embodiment is characterized in that the fold lines of the fanfold are predefined by means of grooves embossed in the plastic films, and wherein in the region of a cross fold line of the map two grooves are embossed in the plastic films 2 to 20 mm apart, along which grooves the map is folded perpendicular to the fold lines of the fanfold, and that a map spine is formed between said two grooves in the region between the two outer
