

ABSTRACT

Provided are a data processing method and apparatus for a virtual scene, and a computer-readable storage medium. The method comprises: receiving a storage request for picture data of the virtual scene, wherein the storage request is generated during the process of a target user executing a virtual scene operation on the virtual scene, and is used for requesting the storage of picture data corresponding to the operation progress of the virtual scene operation; on the basis of the storage request, generating an archive file for indicating the operation progress of the virtual scene operation; on the basis of the archive file, generating and storing a data slice of the picture data corresponding to the operation progress; and when a picture data acquisition request for the operation progress is received, returning the data slice, so as to present, on the basis of the data slice, a picture of the virtual scene corresponding to the operation progress.
