

COMPOUNDS AND THEIR USE FOR TREATMENT OF HEMOGLOBINOPATHIES

CROSS-REFERENCE TO RELATED APPLICATIONS

[0001] This application claims priority to US Provisional Application No. 63/422,847, filed on November 4, 2022, which is incorporated by reference herein in its entirety for any purpose.

FIELD

[0002] Disclosed herein are compounds and methods for the prevention and/or treatment of hemoglobinopathies. Also provided herein are such compounds for use in such methods. Also disclosed herein are pharmaceutical compositions comprising such compounds for use in such methods of preventing or treating hemoglobinopathies.

BACKGROUND

[0003] Hemoglobin is an iron-containing metalloprotein present in red blood cells. Hemoglobin transports oxygen to various tissues throughout the body. Fetal hemoglobin (HbF) is present in fetal red blood cells and is involved the transport of oxygen from the mother to the fetus. After birth, a “fetal switch” occurs, at which point, erythroid precursors switch from producing predominantly fetal hemoglobin to making predominantly adult hemoglobin. Adult hemoglobin and fetal hemoglobin are tetramers containing two alpha- and two beta-globin subunits ($\alpha_2\beta_2$) or two alpha- and two gamma-globin subunits ($\alpha_2\gamma_2$) respectively. Fetal hemoglobin binds to oxygen more strongly than adult hemoglobin.

[0004] Hemoglobinopathies can arise, for example, when there is either abnormal adult hemoglobin expression or structural abnormalities in the adult hemoglobin protein. For example, sickle cell disease, including sickle cell anemia, arises when a person has a point mutation that occurs in the beta-globin gene, resulting in the formation of hemoglobin S (HbS), a hemoglobin composed of two normal alpha-globin chains and two beta-globin type mutated chains. The presence of HbS causes the red blood cells to have an abnormal shape, assuming a sickle form when exposed to decreased amounts of oxygen, which impedes blood flow and can lead to hemolysis. Patients with sickle cell disease suffer from a variety of symptoms including pain, anema, bacterial infections, increased risk of stroke, and reduced life expectancy.

[0005] Another example of a hemoglobinopathy is beta-thalassemia. Beta-thalassemias occur when the beta chain of hemoglobin is reduced or absent. Without treatment, patients with severe forms of beta-thalassemia can suffer from numerous health complications such as poor

growth, skeletal abnormalities, and heart failure. Although beta-thalassemia patients may be treated via blood transfusions, transfusions carry the risk of iron overload and resulting complications with the spleen, liver, and heart.

[0006] Reactivation of functional HbF expression in adult hematopoietic cells has the potential of great clinical benefit in patients with hemoglobin disorders such as sickle cell disease and beta-thalassemia. Hydroxyurea is a current standard of care for sickle cell disease that works via induction of fetal hemoglobin, but it is limited by variable clinical responses, myelotoxicity and the risk of carcinogenesis. Thus, alternative, and more effective, treatments for hemoglobinopathies are needed.

[0057] As used herein and unless otherwise indicated, the term “stereoisomer” or “stereomerically pure” means one stereoisomer of a compound of formula (I), formula (I'), formula (II), formula (II'), formula (III), or Table 1 that is substantially free of other stereoisomers of that compound. For example, a stereomerically pure compound having one chiral center will be substantially free of the opposite enantiomer of the compound. A stereomerically pure compound having two chiral centers will be substantially free of other diastereomers of the compound. A typical stereomerically pure compound comprises greater than about 80% by weight of one stereoisomer of the compound and less than about 20% by weight of other stereoisomers of the compound, greater than about 90% by weight of one stereoisomer of the compound and less than about 10% by weight of the other stereoisomers of the compound, greater than about 95% by weight of one stereoisomer of the compound and less than about 5% by weight of the other stereoisomers of the compound, or greater than about 97% by weight of one stereoisomer of the compound and less than about 3% by weight of the other stereoisomers of the compound. The compounds of formula (I), formula (I'), formula (II), formula (II'), formula (III), or Table 1 can have chiral centers and can occur as racemates, individual enantiomers or diastereomers, and mixtures thereof. All such isomeric forms are included within the embodiments disclosed herein, including mixtures thereof.

[0058] The use of stereomerically pure forms of such compounds of formula (I), formula (I'), formula (II), formula (II'), formula (III) and included in Table 1, as well as the use of mixtures of those forms, are encompassed by the embodiments disclosed herein. For example, mixtures comprising equal or unequal amounts of the enantiomers of a particular compound of formula (I), formula (I'), formula (II), formula (II'), formula (III), or in Table 1 may be used in methods and compositions disclosed herein. These isomers may be asymmetrically synthesized

or resolved using standard techniques such as chiral columns or chiral resolving agents. See, e.g., Jacques, J., *et al.*, *Enantiomers, Racemates and Resolutions* (Wiley-Interscience, New York, 1981); Wilen, S. H., *et al.*, *Tetrahedron* 33:2725 (1977); Eliel, E. L., *Stereochemistry of Carbon Compounds* (McGraw-Hill, NY, 1962); and Wilen, S. H., *Tables of Resolving Agents and Optical Resolutions* p. 268 (E.L. Eliel, Ed., Univ. of Notre Dame Press, Notre Dame, IN, 1972).

[0059] It should also be noted the compounds of formula (I), formula (I'), formula (II), formula (II'), formula (III), or in Table 1 can include E and Z isomers, or a mixture thereof, and cis and trans isomers or a mixture thereof. In certain embodiments, the compounds of formula (I), formula (I'), formula (II), formula (II'), formula (III), or in Table 1 are isolated as either the E or Z isomer. In other embodiments, the compounds of formula (I), formula (I'), formula (II), formula (II'), formula (III), or in Table 1 are a mixture of the E and Z isomers.

[0060] "Tautomers" refers to isomeric forms of a compound that are in equilibrium with each other through the migration of a proton. The concentrations of the isomeric forms will depend on the environment the compound is found in and may be different depending upon, for example, whether the compound is a solid or is in an organic or aqueous solution. For example, in aqueous solution, pyrazoles may exhibit the following isomeric forms, which are referred to as tautomers of each other:

[0061] As readily understood by one skilled in the art, a wide variety of functional groups and other structures may exhibit tautomerism and all tautomers of compounds of formula (I), formula (I'), formula (II), formula (II'), formula (III), or in Table 1 are within the scope of the present disclosure.

[0062] It should also be noted that the compounds of formula (I), formula (I'), formula (II), formula (II'), formula (III), or in Table 1 can contain unnatural proportions of atomic isotopes at least one of the atoms. For example, the compounds may be radiolabeled with radioactive isotopes, such as for example tritium (^3H), iodine-125 (^{125}I), sulfur-35 (^{35}S), or carbon-14 (^{14}C), or may be isotopically enriched, such as with carbon-13 (^{13}C), or nitrogen-15 (^{15}N). As used herein, an "isotopologue" is an isotopically enriched compound. The term "isotopically enriched" refers to an atom having an isotopic composition other than the natural isotopic composition of that atom. "Isotopically enriched" may also refer to a compound containing at least one atom having an isotopic composition other than the natural isotopic composition of that atom. The term "isotopic composition" refers to the amount of each isotope

present for a given atom. Radiolabeled and isotopically enriched compounds are useful as therapeutic agents, e.g., cancer and inflammation therapeutic agents, research reagents, e.g., binding assay reagents, and diagnostic agents, e.g., in vivo imaging agents. All isotopic variations of the compounds of formula (I), formula (I'), formula (II), formula (II'), formula (III), or in Table 1 as described herein, whether radioactive or not, are intended to be encompassed within the scope of the embodiments provided herein. In some embodiments, there are provided isotopologues of the compounds of formula (I), formula (I'), formula (II), formula (II'), formula (III), or in Table 1, for example, the isotopologues are carbon-13, or nitrogen-15 enriched compounds of formula (I), formula (I'), formula (II), formula (II'), formula (III), or in Table 1. As used herein, "deuterated", means a compound wherein at least one hydrogen (H) has been replaced by deuterium (indicated by D or ^2H), that is, the compound is enriched in deuterium in at least one position. It should be noted that if there is a discrepancy between a depicted structure and a name for that structure, the depicted structure is to be accorded more weight.

[0063] "Treating" as used herein, means an alleviation, in whole or in part, of a disorder, disease or condition, or one or more of the symptoms associated with a disorder, disease, or condition, or slowing or halting of further progression or worsening of those symptoms, or alleviating or eradicating the cause(s) of the disorder, disease, or condition itself. In one embodiment, the disorder, disease or condition is a hemoglobinopathy.

[0064] "Preventing" as used herein, means a method of delaying and/or precluding the onset, recurrence or spread, in whole or in part, of a disorder, disease or condition; barring a subject from acquiring a disorder, disease, or condition; or reducing a subject's risk of acquiring a disorder, disease, or condition. In one embodiment, the disorder, disease or condition is a hemoglobinopathy.

[0065] The term "effective amount" in connection with a compound of formula (I), formula (I'), formula (II), formula (II'), formula (III), or Table 1 means an amount capable of treating or preventing a disorder, disease or condition, or symptoms thereof, disclosed herein. In one embodiment, the disorder, disease or condition is a hemoglobinopathy.

[0066] The term "subject" or "patient" includes humans.

[0067] The term "combination" or administration "in combination" includes administration as a mixture, simultaneous administration using separate formulations, and consecutive administration in any order.

[0068] Unless otherwise defined, the technical and scientific terms used herein have the same meaning as commonly understood by one of ordinary skill in the art to which this application belongs.

[00174] A compound of formula (I), formula (I'), formula (II), formula (II'), formula (III), or Table 1 can be administered orally for reasons of convenience. In one embodiment, when administered orally, a compound of formula (I), formula (I'), formula (II), formula (II'), formula (III), or Table 1 is administered with a meal and water. In another embodiment, the compound of formula (I), formula (I'), formula (II), formula (II'), formula (III), or Table 1 is dispersed in water or juice (*e.g.*, apple juice or orange juice) and administered orally as a suspension.

[00175] The compound of formula (I), formula (I'), formula (II), formula (II'), formula (III), or Table 1 can also be administered intradermally, intramuscularly, intraperitoneally, percutaneously, intravenously, subcutaneously, intranasally, epidurally, sublingually, intracerebrally, intravaginally, transdermally, rectally, mucosally, by inhalation, topically to the ears, nose, eyes, or skin, or by local ocular (*i.e.*, subconjunctival, intravitreal, retrobulbar, intracameral). The mode of administration is left to the discretion of the healthcare practitioner, and can depend in-part upon the site of the medical condition.

[00176] In one embodiment, provided herein are capsules containing a compound of formula (I), formula (I'), formula (II), formula (II'), formula (III), or Table 1 without an additional carrier, excipient or vehicle.

[00177] In another embodiment, provided herein are compositions comprising an effective amount of a compound of formula (I), formula (I'), formula (II), formula (II'), formula (III), or Table 1 and a pharmaceutically acceptable carrier or vehicle, wherein a pharmaceutically acceptable carrier or vehicle can comprise an excipient, diluent, or a mixture thereof. In one embodiment, the composition is a pharmaceutical composition.

[00178] The compositions can be in the form of tablets, chewable tablets, capsules, solutions, parenteral solutions, troches, suppositories, suspensions, gels, intra-ruminal devices (*e.g.*, for prolonged prophylaxis or controlled release), implants, topical pour-ons, transdermal delivery gels, spot-ons, implants (including devices, gels, liquids (*e.g.*, PLGA), and the like. Compositions can be formulated to contain a daily dose, or a convenient fraction of a daily dose, in a dosage unit, which may be a single tablet or capsule or convenient volume of a liquid. In one embodiment, the solutions are prepared from water-soluble salts, such as the hydrochloride salt. In general, all of the compositions are prepared according to known methods in pharmaceutical chemistry. Capsules can be prepared by mixing a compound of formula (I), formula (I'), formula (II), formula (II'), formula (III) or Table 1 with a suitable carrier or diluent and filling the proper amount of the mixture in capsules. The usual carriers and diluents include, but are not limited to, inert powdered substances such as starch of many different kinds,

powdered cellulose, especially crystalline and microcrystalline cellulose, sugars such as fructose, mannitol and sucrose, grain flours and similar edible powders.

[00179] Tablets can be prepared by direct compression, by wet granulation, or by dry granulation. Their formulations usually incorporate diluents, binders, lubricants and disintegrators as well as the compound. Typical diluents include, for example, various types of starch, lactose, mannitol, kaolin, calcium phosphate or sulfate, inorganic salts such as sodium chloride and powdered sugar. Powdered cellulose derivatives are also useful. Typical tablet binders are substances such as starch, gelatin and sugars such as lactose, fructose, glucose and the like. Natural and synthetic gums are also convenient, including acacia, alginates, methylcellulose, polyvinylpyrrolidone and the like. Polyethylene glycol, ethylcellulose and waxes can also serve as binders.

[00180] A lubricant might be necessary in a tablet formulation to prevent the tablet and punches from sticking in the dye. The lubricant can be chosen from such slippery solids as talc, magnesium and calcium stearate, stearic acid and hydrogenated vegetable oils. Tablet disintegrators are substances that swell when wetted to break up the tablet and release the compound. They include starches, clays, celluloses, alginates and gums. More particularly, corn and potato starches, methylcellulose, agar, bentonite, wood cellulose, powdered natural sponge, cation-exchange resins, alginic acid, guar gum, citrus pulp and carboxymethyl cellulose, for example, can be used as well as sodium lauryl sulfate. Tablets can be coated with sugar as a flavor and sealant, or with film-forming protecting agents to modify the dissolution properties of the tablet. The compositions can also be formulated as chewable tablets, for example, by using substances such as mannitol in the formulation.

[00181] The effect of a compound of formula (I), formula (I'), formula (II), formula (II'), formula (III) or Table 1 can be delayed or prolonged by proper formulation. For example, a slowly soluble pellet of a compound of formula (I), formula (I'), formula (II), formula (II'), formula (III) or Table 1 can be prepared and incorporated in a tablet or capsule, or as a slow-release implantable device. The technique also includes making pellets of several different dissolution rates and filling capsules with a mixture of the pellets. Tablets or capsules can be coated with a film that resists dissolution for a predictable period of time. Even the parenteral preparations can be made long-acting, by dissolving or suspending a compound of formula (I), formula (I'), formula (II), formula (II'), formula (III), or Table 1 in oily or emulsified vehicles, or adding amounts of PLGA, that allow it to disperse slowly in the serum.

IN VITRO ASSAYS

[00506] **HbF induction assay**

[00507] The expansion, differentiation, and maturation of GCSF-mobilized human CD34⁺ (STEMCELL Technologies Inc.) cells towards erythroid lineage cells were performed using a two-phase liquid culture model (Moutouh-de Parseval LA, *et al.* Pomalidomide and lenalidomide regulate erythropoiesis and fetal hemoglobin production in human CD34⁺ cells. *J Clin Invest.* 2008 Jan; 118(1):248-58). In the first phase, GCSF-mobilized human CD34⁺ cells were cultured using StemSpan™-XF (STEMCELL Technologies Inc.) media supplemented with 1X BIT 9500, Penicillin-Streptomycin (50 U/mL), 100 ng/mL recombinant human (rh) SCF, 100 ng/mL rh Flt3-L, 20 ng/mL rh IL-3 and 10ng/mL rh EPO and the growth of cells maintained in exponential phase for 7 days at 37°C with 5% CO₂ to support expansion and progenitor differentiation prior the second phase and treatment with compounds. In the second phase, culture media was changed to StemSpan™-XF media supplemented with 1X BIT 9500, Penicillin-Streptomycin (50 U/mL), 50 ng/mL rh SCF and 40ng/mL rh EPO to promote further differentiation and maturation of the erythrocytes and to initiate treatment with compounds. Compounds were dispensed in duplicate at a final concentration of 1 µM in a final DMSO amount of 0.1%. Fresh compound was reapplied, and cell density was kept constant every 2 days. After 7 days, the cells were assessed for viability and fetal hemoglobin expression using flow cytometry. For viability analysis, eBioscience™ Fixable Viability Dye eFluor™ 780 (1:1000, eBioscience; Cat# 65-0865-14) was added to the cells and kept in the dark for 10 minutes. For analysis of fetal hemoglobin (HbF), cells were fixed and permeabilized using Fixation Buffer (BioLegend; Cat# 420801 and Intracellular staining permeabilization buffer (BioLegend, Cat# 420201) following manufacturer's instructions. During permeabilization step, cells were stained with PE-labelled Mouse Anti-Human Fetal Hemoglobin (1:10, clone 2D12; BD Biosciences, Cat# BDB560041) incubated at room temperature for 20 minutes and protected from light. PE-labelled Mouse anti-IgG k, (1:10 clone MOPC-21; BD Biosciences, Cat# BDB551436) was used as an isotype control.

[00508] Viability, cell count, and fetal hemoglobin (HbF) levels were measured using an Attune NXT flow cytometer (Thermofisher) and the data analyzed using the FCS express software (De Novo Software). In Table 1 below, the effects of compounds of formula (I), formula (I'), formula (II), formula (II'), and formula (III) on % viable cells, viable cell count, on the % HbF positive cells and the median fluorescent intensity (MFI) of the HbF positive cell population compared to the DMSO controls can be viewed. [00509] **WIZ Assay and ZBTB7A EC50 Assays**

[00510] The HiBiT degradation assay for WIZ and ZBTB7A in HUDEP-2 cells was performed as described below. HUDEP-2 cells engineered to express a HiBiT tag in either the WIZ (Widely interspaced zinc finger) or ZBTB7A (Zinc Finger And BTB Domain Containing 7A) proteins were maintained in low attachment flasks in StemSpan SFEM II media supplemented with Penicillin-Streptomycin (50 U/mL), rhSCF (50 ng/mL), rhEPO (3 IU/mL), dexamethasone (0.4 µg/mL) and doxycycline (1 µg/mL). Prior to start of the assay, cell count and viability were measured by trypan blue exclusion using the Vi-cell XR cell viability analyzer. For the HUDEP-2 WIZ HiBiT assay, cells were transferred to a 50 mL conical and centrifuged at 500g for five minutes. Cells were resuspended in fresh StemSpan SFEM II media supplemented with Penicillin-Streptomycin (50 U/mL), rhSCF (50 ng/mL), rhEPO (3 IU/mL), dexamethasone (0.4 µg/mL) and doxycycline (1 µg/mL) at a density of 1.0×10^6 cells/ml. Forty microliters of cell suspension was dispensed into 384-well Low Flange White Flat Bottom Polystyrene TC-treated Microplates containing pre-dispensed compounds, using a VIAFLO 384 liquid handler, and placed in a 37°C incubator with 5% CO₂. Each compound was dispensed in duplicate and had a final DMSO concentration of 0.1%. After 24 hours of treatment, 40 µL Nano-Glo HiBiT Lytic Detection System reagent was dispensed into each well using a VIAFLO 384 liquid handler. Plates were incubated for 25 minutes at room temperature and the luminescence was read as relative luminescent units using the EnVision plate reader. EC50 and Y-min values were calculated using curves calculated from dotmatics software after the normalization to the DMSO control of 10 different concentrations: 10, 3.33, 1.11, 0.37, 0.12, 0.04 0.0137, 0.0046, 0.0015 and 0.0005 µM respectively.
