CLAIMS

1. A medical container provided by joining together rims of a set of sheet-shaped members disposed facing each other, the medical container comprising:

an accommodation part disposed at a central part in a width direction;

a pair of extending parts that is disposed on one end side in a height direction of the accommodation part, and extends outward in the width direction from the accommodation part, and

partition joining parts that extend from the other end side to the one end side in the height direction, and partition the accommodation part and the extending parts at boundary portions between the accommodation part and a pair of the extending parts,

wherein the accommodation part and the extending parts communicate with each other on the one end side in the height direction of the accommodation part.

2. The medical container according to claim 1, further comprising an accommodating opening provided in a portion of the rims.

3. The medical container according to claim 1 or 2, further comprising a regulating joining part that regulates a position of an accommodated object accommodated in the accommodation part, in the accommodation part.

4. The medical container according to claim 2, further

comprising a regulating joining part that regulates a position of an accommodated object accommodated in the accommodation part, in the accommodation part, wherein

the accommodating opening is provided at an edge on a side where the regulating joining part is disposed in the accommodation part.

5. The medical container of claim 1,

wherein a position of an end portion on the one end side in the height direction of each of the partition joining parts is located on the other end side with respect to one end portion in the height direction of an accommodated object in a state in which the accommodated object is accommodated in the accommodation part.
