

ABSTRACT

To provide a sealing device capable of significantly reducing material loss in forming lids, preventing contamination of foreign matter into containers, and simplifying the overall device configuration.

A sealing device for sealing an opening of a container having an opening and an edge forming an outer periphery of the opening, comprising: a holding part having a holding body that holds the container with the edge of the container exposed; and a joining force imparting part having a joining body for joining the lid to the edge, wherein the holding part is formed to allow a lid pre-formed as a sheet to be placed facing the opening of the holding body, and the joining part joins the pre-formed sheet lid to the container.
