

ELECTRONIC APPARATUS INCLUDING STRUCTURE FOR PROTECTING DISPLAY

【ABSTRACT】

5 This electronic apparatus comprises: a display which is provided in a housing and includes a display panel, a display driving circuit disposed below the display panel, and a protective film surrounding the display driving circuit; a support member which is provided in the housing and supports the display; and a first elastic member which is provided in the housing and disposed on the support member. A sealing member and the first elastic member on the support member are in contact with the protective film. The first elastic member is disposed inside a space
10 formed by a third section of the protective film and the support member, wherein the third section extends to a second section of the protective film different from a first section of the protective film in contact with the sealing member. Various other embodiments are possible.
