

# **RANGING METHOD, APPARATUS, AND SYSTEM**

## **ABSTRACT**

A ranging method, apparatus, and system are disclosed, to implement reliable ranging. A first node measures a first ranging frame to obtain first measurement information (S202), and the first node sends second measurement information based on the first measurement information and a first feedback manner (S203). In other words, a form in which the first node feeds back measurement information needs to be determined based on a measurement result of the first node and the first feedback manner. The ranging method implements feedback of the measurement information in a ranging scenario, and improves ranging reliability and flexibility.
