(54) Title: PROCESSING AND/OR GENERATING CYBERSECURITY TELEMETRY DATA

Figure 11

(57) Abstract: A cybersecurity system comprises a mapping component in the form of program code compiled from a telemetry serialization schema, and a cybersecurity application in the form of program code compiled independently of the mapping component and the telemetry serialization schema, the program code embodying a plurality of telemetry functions. Each telemetry function is specific to a different data type, the cybersecurity application configured to provide to the mapping component a message topic for a telemetry message comprising a data field having a data type that is not known to the cybersecurity application. The mapping component is configured to determine the data type of the data field based on the message topic, and cause the cybersecurity application to apply, to the data field, the telemetry function associated with the data type of the data field.
