

BLOCKCHAIN NETWORK CONFIGURATION METHOD AND COMPUTER SOFTWARE PROGRAM FOR EXECUTING SAME

5 ABSTRACT

There is provided a method capable of continuing to execute consensus building (consensus) even when a predetermined node ceased to operate. There is provided a method comprising a penalty step of monitoring, by computers, whether or not a predetermined node, among nodes constituting a virtual network, was able to perform
10 block signing, and deleting a node that was not involved in block signing for certain threshold consecutive times, from the nodes constituting the virtual network.
