[CLAIMS]

[Claim 1]

The raw material of the coagulated egg-like gelled material is used for producing the coagulated egg-like gelled material like a heat-coagulated material of a melted egg containing liquid egg yolk by adding the raw material to a calcium solution containing an alginate, an edible fat and oil and a carbohydrate and containing calcium ions. The raw material of the coagulated egg-like gelled material has a content of the edible fat and oil of 10-23 mass%, a content of the sugar of 3-13 mass%, and further contains a coloring agent.

[Claim 2]

The coagulated egg-like gelled material according to claim 1, further comprising a protein.

[Claim 3]

The mass of coagulated egg-like gelled material according to claim 2, wherein the protein comprises a vegetable protein.

[Claim 4]

The coagulated egg-like gelled material according to claim 1, further comprising an emulsifier.

[Claim 5]

The solidified egg-like gelled product according to claim 4, wherein

the emulsifier comprises at least one of a hydrophilic emulsifier having an HLB value of 10 or more and a

lysophospholipid.

[Claim 6]

The raw material of the coagulated egg-like gelled product according to claim 1, further comprising sodium chloride, wherein

the sodium chloride concentration in water is 0.5% by mass or more and 5% by mass or less.

[Claim 7]

The coagulated egg-like gelled material according to claim 1, wherein the colorant is a fat-soluble colorant.

[Claim 8]

The method for producing the coagulated egg-like gelled material comprises adding a raw material of the coagulated egg-like gelled material to a calcium solution to produce the coagulated egg-like gelled material which contains calcium alginate, an edible fat and oil and a carbohydrate and is like a heat-coagulated material of a melted egg containing liquid egg yolk. A method for producing a coagulated egg-like gelled product, comprising a step of preparing a coagulated egg-like gelled product without filling a bag, wherein a raw material of the coagulated egg-like gelled product has a content of the edible fat or oil of 10% by mass or more and 23% by mass or less, a content of the carbohydrate of 3% by mass or more and 13% by mass or less, and further contains a colorant.

[Claim 9]

There is provided a soup like food containing a coagulated egg-like gelled product containing calcium alginate, an edible oil and fat, and a carbohydrate, wherein the content of the edible oil and fat is 10-23 mass%, the content of the carbohydrate is 3-13 mass%, and a coloring agent is further contained.
